#### PREFACE.

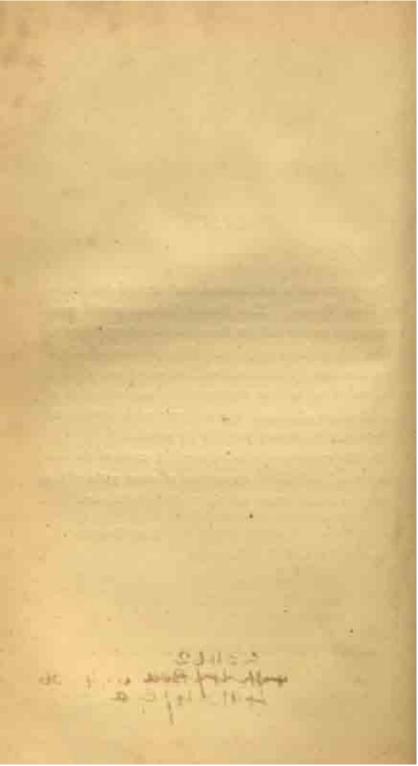

Two years and a half have elapsed since I sent home my First Volume. This Second Volume would have been ready sooner but for the constant interruptions to which I have been subjected. The pressure of official work has largely increased, and, at one time, when I was called on to take charge of the administration of the Province of Orissa, was so heavy as to compel me to lay aside all literary work for six months.

To this cause must also be ascribed much of the disjointed and unfinished appearance of some parts of the work, for which I must ask the reader's indulgence.

JOHN BEAMES.

Curpack, Onissa, April, 1874.

#### COMPARATIVE GRAMMAR

OF THE

## MODERN ARYAN LANGUAGES OF INDIA.

#### CHAPTER I.

#### FORMATION OF THE STEM.

§ 1. Nouns are divided into two classes: those which name objects, and are called appellatives, or in the older phraseology substantives; and those which describe the qualities of objects, and are called attributives, or in the older phraseology adjectives. Both classes will be considered in this Chapter.

The noun as employed in Sanskrit contains three divisions the root, the suffix, and the termination; the root and suffix taken together constitute the stem, the whole three combined form the perfect noun fitted for use in speaking or writing.

Volt. III

Thus naras, "a man," consists of three parts, mar + a + s, where nar is the root, a the suffix, s the termination; mar + a = mara is the stem.

The terminations vary with every relation or connexion of the noun, and their variations constitute what are called cases. In the modern languages the terminations of the Sanskrit nounno longer exist in their original form; in some of the seven languages no trace of them is perceptible in the singular, and only weakened and half-obliterated traces remain in the plural; in none of the languages are more than slight and doubtful indications of their presence still observable. The variations of case are expressed in the modern languages by particles placed after the stem, just as in modern European languages they are expressed by particles placed before the stem. English declension, fish, of fish, to fish, stands in the same relation to the Gothic fisks, fiskis, fiska; and French champ, de champ, à champ, in the same relation to Latin campus, campscampo; ne Hindi-nar, nar kå, nar ko, does to Sanskrit narcas, narasya, naraya.

The first point then to be considered is the formation of the stem, and in this inquiry our attention is entirely concentrated on the final syllable or suffix. When treating, in the First Book, of Phonetic Changes, I exhibited, as far as the materials at my command permitted, those alterations and corruptions which have operated to change the form of the root; and the next stop is to discuss the processes by which the stem, consisting of the combination of root and suffix, has been built up in its manifold developments.

Sanskrit grammarians divide nominal stems into two classes. They do not admit the possibility of a noun being a primitive word, derived from nothing else, but hold that all the words in their language are derived from verbal room (called dhātu), by additions and changes of various kinds. The first class, therefore, consists of those nouns derived from the dhātu directly:

these they call kridanta; the second, of those derived immediately from other nouns; these they name taddhita. I shall use for kridanta the term "primary stem"; for taddhita, "secondary stem."

\$ 2. Derivation is effected by the addition to the dhatu, or root, of certain syllables called pratyaya, or suffix. These suffixes in many cases not merely add a vowel or syllable to the root, but also effect some change in the root itself, either by lengthening the vowel, eliding a final consonant, or in some other way. In order to indicate the effect the suffix has on the root, the Indian grammarians have prefixed or added to each suffix . cortain letters, which serve as a sort of memoria technica. Thus पाक "cooking," would be described as पच + घत्र, that is, derived from the root पच्"to cook" by the suffix घत्र; the effect of this suffix is principally to add a final W to the root, but it also lengthens the root-vowel, and this effect is indicated by the letter F; it moreover changes a final palatal into a guttural, and this is denoted by the W. The number of pratyayas is very great, the grammarians having multiplied them without stint, in order to give expression to the large mass of minute distinctions with which they have encumbered their writings. As, however, we are not discussing Sanskrit grammar, but only the simpler grammar of its modern descendants, it will not be necessary to consider all these suffixes in detail. They may be conveniently thrown into groups according to the vowel or syllables which they actually add to the root, the technical letters being referred to only when the distinction which they mark is of importance in its bearing on the forms of the spoken languages. Among the kridantas or primary stems the Indian grammarians include participles and verbal forms of all kinds, as well as abstract nouns. It will, however, be more in accordance with the principles of linguistic science to reserve the consideration of participles and all verbal formations till the

chapters on the Verb are reached, and to discuss in this place merely those suffixes which form substantives and adjectives.

Suffixes are monosyllabic or dissyllabic. Out of the vast mass of suffixes mentioned by the Sanskrit grammarians, many may be dismissed as unconnected with the present subject, inasmuch as the stems formed by them were so formed before the rise of the modern languages, and the question of their construction is a matter not of modern, but of ancient, grammar. Our seven languages took over these words ready made, and, as far as we are concerned therefore, they may be regarded as primitive words. Only such suffixes will here be introduced as have left traces in the speech of the present times; and if it be necessary to speak of certain of them which are of purely Sanskrit use, it is merely because of their bearing on phonetic or structural processes of recent introduction.

§ 3. Stems in -a. The nouns of this class are of all three genders, and make in the nominative case of Skr., mase. -as, fem. -d, neut. -am. The s of the mase nom., however, is not permanent; before a word beginning with a sonant letter, it, together with the a of the stem, changes into o. Insamuch as the sonant letters in Sanskrit are more numerous than the surds, the form of the nominative case in -e was much more frequently heard than any other; and the vulgar, who are not careful of minute grammatical distinctions, appear even in the surfiest times to have used the termination in -o to the exclusion of all others. Thus Vararuchi (v. 1) gives it as a general rule that o is substituted for an (= as), the technical name of the nom, sing, ending, in all words whose base ends in a, as eschahho, casaho, puriso, for crikshas, crishabhas, purushas. He considers that the a of the suffix has been elided, though it is more probable that the whole termination -or changed into -o through the intermediate form -ah, the labial vowel owing its origin to the involuntary contraction of the

lips during the passing of the soft breathing indicated by the visarga. In Magadhi Prakrit the nom, is sometimes formed in -e, and in Apabhransa in -u.

In more recent times two separate sets of stems developed themselves out of this a-stem. The first probably ended in a in all the languages down to about the fourteenth century; since then it has ended in -a in all but Sindhi, which still retains the termination in -n. In old Hindi and Marathi the nominative in u is distinctly traceable, and in the former is even lengthened to a at the end of a verse where the metre requires a long syllable. This is especially the case in Tulsi Das's Ramayan, a work which exhibits a wide range of popular forms and phrases. Thus we have Itle, बोक, क्याइ, प्रवाइ, at the ends of rhyming lines for note, als, in modern H. मरीर, बीर, sarie, bir. The second ended in e, which in the broad pronunciation of old Hindi sounds su, though the form in e is often used by the earlier poets; and there is no distinction between the two: it is merely a matter of manuscripts, some using one, some the other form. This o softened subsequently still further into d, in all but G, and S., which still retain o.

Concerning the cause of the parallel existence of the two forms there has hitherto been much doubt. Dr. Trumpp considers it a more matter of accident, and thinks the presence of one form or the other is due to habit and daily usage. Dr. Hoernle, however, holds, and with justice, that this reasoning is insufficient, and would ascribe all words which exhibit the a = c termination to the forms of nouns with an added 3, which are extremely common in Prakrit. To this opinion I in the main subscribe. I think myself fortunate in this second volume

i "Eine Regel scheint hei dieser Separation nicht vorgestaltet zu haben, emigstent babe ich his jetzt noch keine entdecken können, sondern der tagtigliche Osbennich scheint sich für die sinn oder andere Kadang entschieden zu haben." Zeinek d. D.M.G. vol. twi. p. 121.

to have hints from other and better scholars than myself, which were wanting when the First Volume was written.

There is, however, one other possible way of accounting for the peculiarity. This is the influence of the accent.\(^1\) It is vigorously denied by some that the Sanskrit accent has persisted until modern times; but it may be urged that the idea is a new one, not altogether without support in facts, nor in any way a priori impossible, and it is not quite fair to dismiss it contemptatously without due consideration.\(^2\) The influence of the accent is naturally confined to words of the early Tadbhava class, namely to words which have come down uninterruptedly from those times when Sanskrit was spoken, and whose form depends on the ear, not on the eye. This is all that is claimed for it: it is not pretended that the Sanskrit accent has been preserved in words resuscitated from the written language by learned men, centuries after it had ceased to be spoken.

With these reservations, the reader is invited to examine the lists hereinafter given, given not in a spirit of dogmatism, but merely because I cannot satisfy myself in rejecting accentual influence in them, till I am met by something more convincing than ancers; though in the desire to arrive at the truth, which is the only object which these researches can possibly have for one in my position, I shall be ready to throw down my weapons and acknowledge myself beaten directly I feel myself fairly convinced.

In any case, whether the influence of the accent be admitted or rejected, the collection of words now given will be useful as

<sup>1</sup> See Vol. L. Ch. I. | 6, pp. 17 ff.

I Unfortunately little is known of the speken accent in Skr. In the following pages, the rules laid flown in Bopp's Vergleichendes Accentuations system have been my guide; but perhaps sinus that was written advances have been made by European writers. These, in my inslated position in the depths of an Indian province, I have no means of obtaining. I am, however, quite consmons of the unfavourable affect isolation has on this, and all other parts of my work, and only wish my critics would hear is in mind sometimes.

(I). Bargiones.—The Sanskrit words in the following list are all accented on the penultimate; they are all primary stoms formed by the addition to the verbal root of one or other of the simple suffixes, such as \(\frac{\pi}{4}, \frac{\pi}{4}, \frac{\pi}{4}, and the like: they are all therefore fair cases in point.

Skr. बोष्ठ "IIp," Pr. बोट्टं, H. बोठ, P. होठ, O. होट, बोठ, M. बोठ, O. बोठ-

Skr. कर्त "ear," Pr. क्सी, H. कान, P. कझ, G. M. B. O. कान, S. कनु. Skr. काछ "wood," H. काठ, and se in all, but S. खाउू.

Skr. जब "armpit," Pr. जक्तो, H. जांख, P. कळ, G. M. B. O. जांख,

S. कहु-Skr. कीश "kos," H. कीस. P. कीह, the rest कीस, S. कोड़-

Skr. क्रम् "trouble," H. क्रम, P. क्लेस, M. क्लिस, क्लिंस, S. क्लिस्

Skr. चर्या "mament," H. खन, क्न, क्नि, the rest खण, S. खिया (fem.). Skr. यमें "scomb," H. बर्भ, गाम, P. id. and गल्म, M. G. गाम, S.

गम्, गर्म्-Skr. साम "village," H. गांव, G. गाम, M. गांव, B. O. गां, S. गाम्-गांच-

Skr. आम "net," 11. जान, so in all, but (). आक्रं, जाई, S. जाई,

Skr. तान "tone," II. तान, so in all, G. तावा, S. तानु-

Skr. तेल "oil," H. तेल, 10 in all, 8, तेलु-

iškr. दल "tooth," H. दांत, to in all, P. दंत, S. दंदु.

Skr. दिन "day," H. दिन, so in all, S. डिग्रु.

Skr. देश "country," H. देस, in the rest देश, S. हेस्.

Skr. पात्र "noose," H. पास, फांस, G. and the rest पात्र, P. पाइ, S. -फादी, फासी.

Skr. Wild "ploughshare," H. Wild, and so in all, but P. W.E., S. WIN.

Sicr. मार्च "road," H. मग, मांग, in the rest माग, S. माजू.

Skr. जीक "world," H. जीम ("poople"), in the rest जीक, S. जीक, जीम.

Skr. वंग "bumbee," H. बांस, बांश and so in all, S. बांसु.

Skr. 적군 "banian-tree," H. 적명, so in all, M. O. 적군, S. 적중.

Skr. विष "poison," H. विश्व. B. विष, M. G. id. and विश्व. P. विश्व. विस. विह. S. विश्व and बिहा.

Instances might be multiplied to a large extent, but the above will suffice to show that the rule holds good in a vast majority of instances, Sindhi having uniformly u, the other languages u, though Gujarati now and then retains u. This final short u is not prenounced at all in Hindi, Panjabi, Marathi, or Gujarati, and very slightly in Bengali and Oriya. We hear jal, tân, tel, dânt, and so on, not jalu; words of this class may, for practical purposes, be regarded as ending in consonants, except in M. and G., where it is necessary, as will be shown hereafter, to bear in mind the existence of the final mute u, in order to effect the necessary changes of the base in the oblique cases of the singular.

(2). Oxytomes.—The list which follows comprises, like that which precedes, none but primary stems formed by simple suffixes, as we, we and the like; but the words which it contains are all accented on the last syllable, and accordingly it will be seen that they all end in the modern languages in d or o.

Skr. भगड "egg," H. भंडा, P. id., B. भांडा, O. id., S. आनी, M. and G. are exceptions, M. भंडे, G. इंड्र-

Skr. बीट "worm," H. बीडा, and so in all, G. and S. बीडो.

Skr. not "knife." H. not, and so in all, G. and S. not. (In all the fem. not is more commun.)

Sicr. चेंद्र "alave," H. चेंद्रा, चेला, m in all, G. and S. चली-

Skr. चूर्य "dost," H. चूरा ("powder"), so in all, O, and S. चूरों, M. and B. also चूर.

Skr. चूर्ण "dnst," H. चूना ("lime"), P. id., M. चुना, चूला, B. O. चुना,

B. also चुन, G. and S. जूनो, जूगो.

Skr. दीप "candle," H. दिपा, O. B. M., P. दीजा, दिवा, M. दिवा, G. दीवो, S. दिजो

Skr. अंज "flag," H. धजा, P. Id., G. धजो.

Skr. नाज "stream," H. नाजा, and so in all, G. नाळी, and नाऊं, S.

Skr. फ्या "anake's hood," H. फ्या, M. B. O. id., G. फ्यो, S. फ्या (fam.). Skr. चत्स "young," H. घचा, बद्धा. and so in all, B. बाझा, G. बद्धी. S. बची.

Skr. भज "spear," H. भाजा, P. M. O. id., G. and S. भाजी.

Skr. भ्राच "brother-in-law," H. साला, P. M. साउटा, B. O. जूला, G.

Skr. खान्य "shoulder," H. कांधा, P. कंधा, M. खांद्रा, O. B. कांधा, G. S. कांधी

Skr. समा "post," H. संभा, P. B. O. id.

Skr. मूच "mouse," H. मूसा, P. B. id., O. मूपा.

Skr. वर्ष "rain," H. बर्सा, बर्खा, O. बर्पा, B. M. Id., G. वर्षी.

The Hindi in this, as in so many other instances, vindicates its right to be considered the leading language of the group, by the fidelity with which it adheres to role. The other languages are less faithful to the long vowel representing the oxytone, than they are to the short vowel derived from the barytone stams. Marathi especially diverges in this respect, but the divergence is probably due, as will be seen hereafter, to its practice in modifying the final vowel of the stem in the oblique cases. Bopp's rule for stems formed by the addition of simple a is that they carry the accent on the root-syllable in most cases. He excepts, however, a class of abstract stems formed from roots in i and i, which allow the accent to sink down to the final syllable. They are as follows:

Shr. चि चय "destruction," H. क्य, P. के, S. कीचो, G. खे, M. बी. Not used in B. and O. except as Tatsama.

Skr. चि चय "heap." In compounds H. संदे, M. चय, संत्रय, etc.

Skr. जि जय "victory." In all जय or जे.

Skr. fer wa "smiling." Not in use.

Skr. हि हय "horse." हय and है in the old poets; often with an additional syllable हेयर in Chand.

Skr. की अय "huying." In compounds H. विकी (विकय), B. O. id., P. विकरी, S. विकिरी.

Sar. भी भय "fear," H. भय, B. O. id., P. में, S. भइ and भव, M. G. भय

Skr. जी जय "abode." In the compounds with आजय, as below. Skr. देवालय "temple," H. देवज, P. देवाजा, S. देविजी, G. देवळ, M. देजळ, O. id., B. देवज.

Skr. खगुरालय "father-in-law's house," II. सुसराज, M. सासरे. Skr. वि अय "refuge," In the compound षायय, II. आसरा, P. id., M. आखा, B. O. id., G. आसरो, S. आसर, आसिरो.

In all these words the inherent weakness of the 2 has led to the corruption of the two syllables of the Skr. into one in such words as áścá, decâlá, while in others it has been practically softened into a diphthong in combination with the preceding consonant. It may also be conjectured that though the learned accentuated the last syllable of stems of this small class, the masses did not at any time observe this distinction, but treated

<sup>1</sup> Vergl. Accontuationssystem, § 115.

them as barytones, and the final vowel has therefore not been preserved.

There is also a rule of a somewhat intricate character, which declares that stems of this form, when simple appellatives, which, according to their original meaning, are nouns of agency, bear the accent on the last syllable. Under this head are such words as

nuild, "river," or the sounder (root बद "to sound").

placed, "ship," or the swimmer (root मु "to float").

chard, "thief," or the steeler (root मु "to steel").

kard, "hand," or the maker (root क "to do").

maghd, "cloud," or the wetter (root बिह "mingere").

devd, "god," or the shiner (root दिव "to shine").

It is obvious, however, that nouns of this class may be formed to any extent by a little exercise of the imagination. Every noun in fact formed by the suffixes ach, ghan, or ap and the like, which merely add a vowel to the root, might be classed as a nomen agentis, and expected to be an oxytone. There is no reason why garbha, "womb," should not be considered as a noun of the agent, meaning the container (root यह " to hold "), or karna, "the ear," as the piercer (root will "to pierce"), or cisha, "poison," as the pereuder, from its action in stealthily ereeping into the blood (root [34 "to penetrate"); and as a matter of fact the grammarians do so regard them all. The rule appears to be too subtle for general practical use, and the following list of oxytones of this class, mostly formed with we. which is said specially to form agents, will show that in a majority of instances the modern languages have not regarded these words as oxytones.

```
Skr. कर "hand," H. कर, and so in all, S. कर.
Skr. नद "river," H. नद, M. id., perhaps S. नदी "tube," but also नहु.
Skr. नेघ "cloud," H. अघ, and so in all, S. मेघु.
Skr. चोर "thief," H. चोर, and so in all, S. चोर-
```

Skr. देव "god." H. देव, देउ. se in all, S. देउ and देउ. (In Muhammadan Sindh it means "a devil.")

Skr. इंग् "gadfly" (the litter), H. इंग्न, इंख, and so in all, S. इंग्नु "the bite of an insect or reptile."

Skr. बर् "bridegroom," (he who chooses the wife), H. बर, P. B. O. id., M. G. बर, S. बब्

4. Under this rule is included a large number of adjectives which are oxytone in Sanskrit, and end with long & or o in the moderns. It may, however, be observed, that the majority of adjectives from a-stems end in a or o in the masculines, except in B. and O., where the habitual neglect of quantity has led to the final vowel being shortened. The rule therefore hardly covers all the examples, and is perhaps not meant to do so, as Bopp merely includes adjectives with the meaning of the present participle. We may suppose that the rule, once established for this class of adjectives, gradually extended itself to the others also, on account of the facility which the variety of terminations so obtained afforded for making the distinctions of gender. In those languages which pay little or no attention to gender, as the Bengali and Oriva, the distinction was not needed, and we hear in O. such phrases as boyo bhai, "eldest brother," and boyo bhauni, "eldest sister."

Examples of adjectives—(o) indicates oxytone, (b) burytone adjectives:

Skr. 鬼歌 (b) "clear, good," H. 鬼歌!, P. id., G. 鬼歌!, S. 鬼歌!
("white"), B. O. 鬼歌.

Skr. चन्ध (a) "hlind," H. चंधा, P. चहहा, G. ग्राधको, M. चंधका, B. O. चन्ध, S. चंधो,

Shr. वर्त (6) "half," H. आधा, P. चता, G. आध, चरधो, S. चधु,' M. चर्धा, B. आधा, O. बधा, वधे.'

<sup>1</sup> Used as a substantive.

Skr. उद्य (e) "high," H. कंगा, P. उद्या, S. कंगो, G. कंगो, M. उंग, B. O. id.

Skr. जान (b) "black," H. काना, P. M. जाळा, G. जाळो, B. कान, काना, O. कळा

Skr. काम (e) "ane-cyed," H. खाना, P. M. कामा, G. S. कामी, B. कामा, O. काम-

Skr. गंभीर (e) "deep," H. महिरा, गहरा, and so in all, O. महिर-The Taisamu गंभीर is also in use in all.

Skr. माड (a) "intense," H. माडा, P. id., G. माडो, M. B. O. माड. Skr. मीर (b) "pale," H. मीरा, P. id., S. G. मीरो, M. (dimin.) मोर्टा. O. मीरा, B. मोर.

Skr. धन (\*) "dense," H. घना, P. घणा, S. G. घणी (many, much), M. घल, O. B. घन.

Skr. बाडिन (a) "hard," H. कडिन, O. B. id., P. कडन, "मा, G. कडम। M. कडीम, O. B. कडिन, S. कटनु

Skr. द्विस (b) "right" (hand), H. दहिना, O. दाहास, B. दाइन-Skr. वधिर (a) "deaf," H. वहरा, वहिरा, M. id., G. देहेरी, S. बोडो, B. बहेरा, O. वहिरा-

, Skr. मुख्त (e) "dry," H. सूखा, P. सुझा, G. सुकी, M. सुका, S. सुकी, O. सुविका, B. मुका

There are very many other instances. Hindi preserves the long vowel which naturally arises from exytenes, and lengthens the vowel in many cases in barytones; in a few Tatsamas like \*\*157 the long vowel is not taken. The accent is thus virtually neglected, and in this respect Hindi is followed generally by P. S. and G. Marathi halts between two opinions, sometimes taking the short vowel, sometimes the long; the latter, however, appears to be the more common of the two, as might be expected in a gender-ridden language like this. More remarks about the adjectives will be found scattered amongst the various stoms.

<sup>:</sup> Deep (solver), strong (infusion of a drog), thick (cloth), see.

§ 5. The influence of the accent is only claimed for the early Tadhhava class, and it is natural therefore that there should be many instances in which it does not apply. Seeing that there are among the late Tadhhavas many which approach closely in point of antiquity to the latest of the early Tadhhavas, the line is hard to draw. We merely give examples therefore of these exceptions, and wish for explanation as to why, if the stems in d-o are due to the addition of ■, that suffix has not been used here also. Many of the words now given appear, from their phonetic structure, to be early Tadhhavas, as for instance ▼w. which exhibits the Prakrit process of assimilation from ▼w into ▼w. and the modern further elimination of the first element of the nexus and compensatory lengthening of the preceding vowel.

(1). Of Sanskrit oxytones which take the short or barytone ending in the moderns, the following are some of the more prominent examples:

Skr. सिंह "lian," II. सिंघ, P. id., the rest spell सिंह but pronounce singh, S. both सिंघो and श्रीज़.

Skr. चाव "bear," H. रीक्, G. id., M. रीस, P. रिक्ट, S. रिकु, O. (rare)

Skr. गृह "house," H. चर, and so in all, S. घर, O.-H. गृह, M. id.

Sicr. वर्ष "year," H. ब्रम, and so la all, but S. वहाँ.

Skr. पर्यो "leaf," H. पान (betel), and so in all, S. पानु.

Skr. माव "nature," H. भाव, भाषी, and so in all (भाउ).

Skr. दास "slave," H. दास. and so in all, S. दासु.

Skr. दुग्ध "milk," H. दूध, and so in all, S. दोधि.

These words are all very common words in constant daily use, and as such should, according to the st theory, have taken that suffix in Prakrit, and consequently end in d-o in the moderns. Some of them have an alternative form in d, as well, which has use "a leaf;" ud, which has use and some in d.

the sense of "rain;" the meanings of पान and चरस are secondary or restricted, as compared with पता and चरसा, and they are perhaps late Tadbhavas in the former, but early Tadbhavas in the latter sense.

(2). Barytones in Sanskrit, but taking the long vowel in the moderns, are the following:

Skr. बोइ "iron," H. जोद्दा, P. B. id., but M. G. O. बोइ (O. also जुद्दा), S. बोड़

Shr. सुवर्ष "gold," H. सीना, P. B. O. id., but M. सीने, G. S. सीनु-

I cannot find many undoubted examples of this class, and even those that do occur do not run through the whole seven languages, which seem as a general habit to be more faithful to the barytone accent, especially in substantives, than they are to the oxytone, or, if we accept the \$\mathbb{A}\$ theory, to be derived from words which did not take the \$\mathbb{A}\$ termination, more frequently than from those which did.

§ 6. Stems in -un and -ana. The former of these is in use only in a very small class of words, all of which, with one exception, are oxytone in Sanskrit. The words are—

" to sacrifice." waina from way, " prachl, "to ask." prukud "to strive." entl. watna or. "to shine." cíchh, eikna 100 " to nak." w wich, and fem. yachna "to thirst." trinh, trishna

The exception is sudpan from sheep, "to sleep," which, however, the grammarians derive by the suffix नग. while the others are formed by नह-

In the modern languages these words, many of which are much corrupted, take the under-mentioned forms:

Skr. यञ्च "mucrifier," Old-IL जजन, अस्म, अस्म, II. जाम, P. जन, M. B. O. जान, S. जन् Skr. यहा "effort," H. जतन, P. M. G. id., S. जतनु.

Skr. HN, "question." Not in use, except as a rare Tatsama.

Skr. विद्य "shining, light," H. विश्वान ("dawn"), विश्वनसार or भिन् सार, M. विविद्ध, S. विभास, विभिन्ना. (The M. and S. are compounds, of which the first part represents विद्य.)

Skr. स्त्रप्र "dream," Old-H. सुपन, सोपन, P. सुपन, सुपना, S. सुपनो, G. सुपन,

In these words the accent is entirely neglected; strangely the only word in which Panjabi and Sindhi exhibit oxytone terminations is precisely that one which is barytone in Sanskrit. It will be more convenient to take the feminines of this and all the other -a stems together later on.

The suffix -one is one of the most commonly used of all. It is of all three genders, and in the large majority of instances is barytone, carrying the accent on the root-syllable. A few cases exist in which the first syllable of the suffix bears the accent, and some in which it is exytone, but the rule is that they should be barytone.

The masculine contains simple appellatives whose original meaning was that of the agent. They are not much used in the modern speech, and when they are, occur as Tatanmas, or as very slightly changed Tadbhavas. Being mostly simple words with strong consonants, they offer no opportunity for phonetic changes, and may therefore, in spite of their identity with the Skr. form, be ancient words. I give a short list, as there is not much to be learnt from them, beyond the fact, important to the present portion of our inquiry, that they take in every case the barytone form.

Skr. जन्द्न "sun" (the delighter), H. जंदन, and so in all. Chiefly used in poetry.

Skr. गायन "singer," H. गायन, and so in all. Chiefly used in poetry. Skr. द्पेंग "mirror" (the flatterer), H. द्पेंग, and so in all, except S. Skr. दहन "fire" (the burner), H. दहन, and so in all.

Skr. इश्रम "tooth" (the biter), H. इश्रम, and so is all, except S. Poetic.

Skr. तर्म "raft" (the crosser), H. तर्न, and so in all, except S. Poetic,

Skr. farq "ray" (the shiner), II. fare n. and so in all, S. farefur.

Skr. चौद्न "holled rice" (the moistener), H. चौद्न, and so in all, except S. Poetic.

Three adjectives, oxytone :

Sir. क्षोधन "angry," H. क्षोधन (rare).

Skr, रोपण "angry," H. रोपण (rare), S. दक्षिणो comes from another

Skr. रोधन "obstructive," H. रोधन (rare).

Far more widely used, and in every sense more important, is the neuter form. Two classes must be here distinguished: the first, simple appellatives, or names of objects or actions; the second, abstract nouns which have the meaning of the performance of an action, or the being in a state. The latter are in fact the infinitives of verbs.

The first class is always barytone, both in Sanskrit and the moderns.

Shr. अङ्गन, "courtyard," H. आंगन, अंगन, P. B. O. id., O. आगगु. S. अङ्ग

Shr. जाञ्चन "gold," H. जांचन, and so in all but S.

Skr. चन्द्र "sandal-wood," H. चंद्र, in all, B. संद्र्य-

Skr. जीवन "life," II. जीवन, so in all, P. जीव, 8. जीव.

Skr. जान "song," H. जान, so in all.

Shr. खान "bath," H. स्तान, असनान, P. B. O. id., G. स्तान and नहाता.

M. जहाण, नाहण, 8. सनान्-

Shr. नयन "eye," 11. नयन, तेन, so in all, G. नेम (masc. pl.), S. नेग्

Skr. भारत "memory," H. मुसिर्न, so in all.

Skr. वेसन "rolling plo," H. वेसन, so in all, O. वेसस्।

The second class consists of words which, though simple nouns, and as such regularly declined, perform nevertheless in four out of the seven languages the functions of an infinitive.

Thus from Skr. कर्य "the net of doing," H. करना "to do," P. करना. 8. कर्यु, M. कर्यो.

It is unnecessary to multiply instances, as every verb in each of these languages forms its infinitive in this way, absolutely without exception. In Bengali and Oriya the form exists, but simply as an abstract noun, almost entirely restricted to grammatical and other works. The real every-day infinitives of those languages are formed in a different way. Gujarati also wants this form.

In Sanskrit the formations of this class are regularly barytone, and accentuate the root. In M. and S. they are also barytone, but in H. and P. they take the long vowel. It does not appear, however, that this is a regular exception. In old Hindi the infinitive of this class-I say "of this class" because there is another infinitive in al-ends always in the short vowel. For example, Chand (a.p. 1200) uses the phrases: जद हरन की " (in order) to seize the victory," aun fauit "having plotted to hind," बंग जुरन जानिम जुझार "a warrior terrible in the tug of war." In the modern idiom we should have इरने की. वांधना. and बोडने में respectively. This consonantally terminated form, or rather (as it is pronounced in poetry) this form ending in short a, is used by the poets as far down as the middle of the seventeenth century. Gambhir Rai (circu 1650) has कोज न कुइन पार्च "(that) no one might be able to touch." Tulsi Das (1600) employs this form regularly in his Ramayan, e.g. रखबार तव वर्जन चार्ग "the keepers then began to forbid (them)," Sundara Kand. 60, 15. From Bhaktamala (1630): मांगन की भायों "he ran to beg." I have only picked out an instance or two at random, as the practice is universal,

It will be more appropriate to discuss this matter at full

length under the Verb, and I therefore content myself here with saying that the long vowel appears not to be in any way whatever due to the accent, but to have arisen from the influence of the anuswara (see Vol. I. § 65), by which karanam became first with, then with minimitive is still neuter, and it is masculine in the H. P. and S. merely because those languages have lost the neuter, and only retain the other two genders.

This infinitive is also in certain phrases used as a simple moun, as in Hindi चेना देना or चेन देन, literally "taking and giving," but idiomatically expressing the state of one's loan account with a banker or money-lender; देना पादना "to give and to receive," idiomatically the outstanding assets and liabilities of a mercantile concern. In Sindhi, words of this class sometimes take the form in o, as

ड्रियमो "a debt," विश्वमो वदगी or विश्वमो जहमी "debts and credits" (but विश्वम "to give").

भरियों or भर्यों "embroidery" (lit. "filling up," भर्यु "to fill"). मङ्गों "betrothal" (मङ्गु "to ask for").

In these cases the ₹ inserted before the termination is inerganic, and merely due to the preference of Sindhi for that sound (Vol. I. § 32). In Hindi and the other languages, nouns of this kind are more generally feminine, and so also in Sindhi; in Marathi and Panjabi also the fem. form is more usual. Thus

> Sindhi चवसी "saying," verb चवसु "to say," # हजसी "going," verb हजसु "to go."

And with short i-

Similal farefur "swallowing," verb faren "swallow."

Hoernle in a recent article in Journ. As. Soc. Hungal, 1873, vol. xiii. p. 68, controds for the derivation of these infinitives from Skr. horeulpus, etc., overleaking the intermediate forms of the mediaval poets, which militate strongly against his conjecture.

When added to causal verbs, this suffix, which then takes also the form wall and, is used to express the idea of the cost of doing, or wages for doing, an act; as

Sindhi खणावारे "porterage," verb खणाइकु "to cause to carry."

- , बाराबो "grazing fees," verb चार्या "to cause to graze."
- . पुत्रारियो "cost of washing," verb पुत्रार्थ "to cause to wash."

Hindi has words of this class, as संगरी "betrothal," सरशी
"woof," सहरी "lading," but more frequently as consonantally
terminated masculines, as भरण पोषण "feeding and protecting,"
"maintenance." Marathi is perhaps the richest of all the
languages in words of this formation. It is, however, as will
be seen from the following examples, very capricious in its use
of such words, sometimes using a mase, in भा, at others fem. in
भी or भ, or neut, in भ or भ.

Verb ugil "to stop," ugil (m.), a slip of bamboo to fasten a door with.
ugil (f.) ) a slip of bamboo to strengthen the
ugil (n.) dege of a winnowing-basket.

Verb क्सची " to bind," कसची (f.), ligature.

Verb 電话前 "to cut," 電话側 (f.), a cutting or reaping, i.e. the quantity cut at one time.

Verb काडणें "to take out," काडणों (f.), removal of crops from a field.
" काडणें (\*), a pitcher to draw water from a
well with.

Verb सोहते "to dig," सोहती (f.), a digging.

Verb घोळी "to stir," घोळवा (n.), a sifting, the quantity sifted at one

" " चोळणा (m.) ) a stick for stirring grain while it

§ 7. The next class of -a stems is that in which the final letter is preceded by a semivowel, as ya, ra, la, va. Of these

ya is chiefly used in Taddhitas or secondary stems; there are only a few primaries, which, being feminine, will be treated

separately.

(1). Stems in ra are of two kinds, those in which the suffix is joined immediately to the root, and those where a joining vowel intervenes. Both kinds are for the most part oxytons in Sanskrit, and the accent is lost by the rejection of the last letter of the nexus; the whole suffix thus ordinarily disappearing.

(a). Examples of words where the suffix is joined immediately

to the root-

Skr. ब्रास (e) "cloud," M. ब्राम, ब्रासा, G. ब्राम, S. ब्रमु. In the rest Tatsams.

Skr. आस (a) " mango," H. आम, चंब, P. id., B. O. आंब, आस. G. आंबी (the tree), M. आंब, चंबा, S. चंबु and आमी.

Sir. 3g (e) "otter," H. mg, P. ma, M. G. 3g, B. O. 3g.

Skr. चट्ट (e) "moon," H. चांद, and so in all; but P. चंद, S. चंदु

Skr. गुप्त (b) "vulture," H. निश्च, P. id., M. G. निष्ट्, मीट्, निध. S. निश्च, B. O. not used.

Skr. ताम्र (\*) "copper," H. तांबा, P. id. and तंबा, O. id., B. तामा. G. तांबु, M. तांबे, S. दामी.

Skr. बाघ (e) "tiger," H. बाघ, and so in all, S. बाचु-

str. समुद्र (6) "ocean," II. समुद्र, समुद्र, समुद्र, P. id., the rest समुद्र, S. समुद्र,

Shr. 115 (0) "Sudra," II. 1151. In the rest Tutsama.

Only two of these words take the long -d, and of these distinct may be derived from the Sanskrit form distance, which would lose the &, and the two vowels would coalesce into a long vowel, as will be shown hereafter. HET was probably regarded as an adjective. WHT in M. is fem., the change of gender accounts for the long vowel.

(β). Examples of words where the suffix is joined to the root by a joining vowel—

Skr. चमर (e) "chowry," H. चीर, चीरी, P. चीर, G. चीरी, M. id., O. चंबर, B. चीर, S. चोर.

Skr. दर्दर (6) "frog." H. दादर, P. G. id., S. डेडब.

Skr. देवर (e) "Innhand's younger brother," H. देवर, P. M. id., G. देर. B. O. देवर, S. डेब्.

Skr. धतूर (\*) "dhatura tree," H. धतूरा, P. B. M. id., O. धतूरो, S. धातुरो, O. धृतुरा, धुदुरा

Skr. बदर (a) "jujube," H. बैर, बेर, P. id., M. G. बोर, B. बदर, O. बर, S. बेर, बेरि

Skr. धमर (e) "bee," H. भंबर, भीर, P. Id., O. भंबर, M. भीर, B. भीगर, S. भींब-

Skr. मन्दिर (0) "temple," H. मन्दिर, and in all.

Skr. वर्कर (o) "goat," H. बकरा, B. P. id., O. बज़ा, G. बज़री, S. विकरो, but M. बोकड

Skr. बगुर (8) "father-in-law," H. समुर, P. सीहरा, S. मुहरी, M. सासरा, G. ससरा, B. O. बगुर.

There is not much uniformity in this list. Sanskrit exyteness end in the short vowel in Hindi and the rest; and the one barytone is in P. S. M. and G. terminated by the long vowel, though the others keep the short vowel. Under the head of nouns in will be found an attempt to explain a good deal of this discrepancy. My method of reasoning does not admit of the usual alipshod way of accounting for the difficulty by setting it down to "caprice" or "lawless licence." There is a reason for everything in this world, if we can only find it out; and if we cannot find it out, it is only honest to say so, and not to try and cover our ignorance by saying there is no law. Some words of wide daily use have all sorts of forms; if we knew more about the subject, we should be able to give a reason

for all of them: perhaps some day we or our descendants may be able to do so. For instance, the word चक (oxytone) "a wheel," has the following long list of forms in modern times.

II. सकर "cart-wheel;" चक्कर, चाक, चकरी, चक्की (a mill-stone);

P. चक्क, चकर, चक्कर: चकला, चकली, चकळी। चक्की, चकुला,

8. चळक्, चकरि, चिकरि, चकी, चकु, चकी, चकुनी, चकुनी, चकुनी,

G. चल्लर, चक्र, चातः चल्ली, चत्री, वाकी, चाकळी.

M. चतः चतलाः चतलीः चतीरः चत्राः चत्रीः चत्रः चातः चाकीः

- 0. चवा. चवाडा, चवाडी: चवाना, चवा, चवी, चवा: चाक
- 11. चन, चकता, चक्र, चकर, चाक, चाका, चाकी, चाकती.

All these may be undoubtedly accounted for by special rules. Their significations are very various, all resting on and derived from the primary idea of roundness. To enter into a detailed examination of all of them would take too much time and space. I therefore pass on to the next form.

- (2). Stems in la. Many nouns ending in la do not come under this head, because the l is part of the root, काल, कुल, बाल, आल and others, which are to be considered as formed by pratyayas leaving a only. Of those which are really formed by the suffix la, the following are some of the commonest.
  - (a). Substantives.

Skr. कसस (6) "lotus," H. P. कमस, कंदन, M. G. कमऊ, O. id., B. कसस, S. कंदन

Skr. कामज (e) "blanket," II. कम्मज, कंवज, P. कमऊ, कंवऊ, G. कामऊ, कावळो, कमऊो, M. कांवळा, O. कमऊ, B. कमजा, विचा, S. कमरि.

Skr. जर्बन (e) "mouthful," H. कीन, बुत्ती, P. कुनी, कुर्नू, G. कीळियी. M. जवन, B. (). कुत्ती, कुत्ति.

Skr. बद्ब (o) "plantain," H. बेबा, P. O. id., S. बेविडो, G. केळ, बेर. M. बेळ, B. बबा, बदिबा.

Skr. कुण्डम (0) "earring," H. कुंडम, P. कुंडळ, S. कुंडम, O. कुंडळ. M. B. O. कुण्डम.

Skr. कोकिन (a) "kod," H. कोइस. P. S. B. id., G. कोयळ, M. कोवीन, O. कोयळि

Skr. पिप्पस (b) "pipal-tree," H. पीपस, P. B. पिप्पस, O. पिम्पळ, M. M., G. पिपस, S. पिपिस,

Skr. मण्डल (b) "circle," H. मंजून, and so in all, M. G. O. also संहत.

Skr. युगल (\*) "pair," H. जुगल, P. G. B. id., O. जुगळ, M. जुळा. नुवळ: जुवळा (twis, adj.), जुळे (twiss, s.m.), जुळी, जुळ

Skr. मृहज (a) "chain," H. सांबर, सांबज, संबर, P. संघर, S. id., G. सांबळ, M. id. and B. धिकन, O. धिकळ.

(B). Adjectives.

Skr. चंचल (o) "tremuleus," H. चंचल. चंचला. चांचल. P. चंचल. S. चंचलु, G. चंचळ, M. B. O. चंचल.

Skr. शिविज (a) "loose," H. डीजा, P. दिखा, S. दिरो, दिलो, G. डीजो व्हें वर्ज, M. दीज, O. दिजा, B. id.

Skr. भीतज (e) "cold," H. सीतज, सीजा॰ई, P. सीतज, सिद्धा, S. सीतजु, M. भीतळ, O. id., B. भीतज.

In the case of adjectives, the Tatsama form does not take the long vowel, while the Tadbhava forms do to a great extent. This confirms the general theory. Tatsamas resuscitated after the Sanskrit language had ceased to be spoken would naturally not follow the accent.

<sup>2</sup> Chiefly used in the some of rinsing the mouth with water after eating.

<sup>\*</sup> The Origan probably berrowed this word from the Marathea, as it is only found in the names of a few places, probably founded during the Maratha rule. The Origan generally use 386 or 386. from 387.

(3). The suffix eq is employed to form both adjectives and substantives. It is not of common use. Examples:

Skr. WE (b) "horse," only used rarely as a Tatsama.

Skr. पार्श्व (e) " side," S. पासी, M. पासल.

Skr. विम्ल (b) " bel-tree," H. वेस, B. M. O. id.

Skr. पञ्च (6) "ripe," H. पञ्चा, P. M. O. id., also पिका, S. पकी, G. पाकी। B. पाका

Skr. पूर्व "eastern, former," H. पुरुब, in the cast पूर्व, S. पूर्व Skr. सर्व "all." H. सब, सार्ग, B. id., O. सबु, P. सर्व, सभ, S. समु

but in the locative case und it forms an adverb of place, und "near," in all the languages. As, however, we are discussing the formation of the stem with especial reference to its termination, this adverb does not concern us here. In the case of so familiar a word as und "all," many irregularities might be expected to have crept in; thus we have the barytone und, as well as the oxytone und, the latter by the rejection of the chand uses an oblique singular und, which would point to a non-und, if we could place any reliance on so rude an author. The final vowel is, however, often morely inserted to eke out the metre; as in the hymn to Ganesh (i. 27, 26):

## सबै कका असी। तुष्टीनाम ससी॥

"Before all affairs, thy name is prefixed."

Here the metre is Chhanda-viraja:

§ 8. The suffix ma forms adjectives, and masc. and neut. substantives. It is generally oxytone, though there is also a

This constant use of subbat in Chand may be nothing more than a Prakritism for the nome pl. of Skr. serves.

class of appellatives which carry the tone on the root-syllable. Examples:

Skr. वर्म ( $\delta$ ) " mud," H. काट्रा, काट्री, G. काट्य, O. काट्य, B. काट्रा.

Slor. साम (b) "village," H. गांद, S. गांद, गाम, G. गाम, M. गांद, B. O. गां,

Skr. धर्म (n) "heat," H. धाम, M. O. B. id.

Skr. 夏軒 (a) "tree," H. 夏軒, and so in all.

Skr. धूम (e) "smoke," H. धूआं, P. id., S. दूहां, M. G. धूम, B. धुयां. O. धूआ.

Skr. UH (6) "justice," H. UTH, and so is all.

Shr. बाम (6) "Jeft-hand," H. बाद्यां, बावां, P. बाह्यां, G. M. बाम, B. बां, O. id. and बाम.

Skr. हिम (o) "mnw," H. हिम, M. हिचे. In the rest Tatsama.

Skr. हम (0) "gold," Old-H. हैं, हम.

There are not many examples of this suffix. In most of them, where not still in the Tatsama form, the weakness of the A, which passes into A preceded by anuswara, has caused the loss of the final syllable to be very common. In many cases the A has itself disappeared, leaving only the anuswara; and in with all the content of the anuswara is lost.

§ 9. The suffix kn is of very frequent use in Sanskrit, and in the modern languages its use is extremely common. It branches out into many different classes, and its discussion is embarrassed by the fact that it is employed both as a primary and a secondary suffix. We are not directly concerned, however, with the minute distinctions which Sanskrit grammarians find necessary; for our purpose it suffices to take the Sanskrit noun as it stands, without troubling ourselves to inquire whether it be formed by adding the suffix to a verb, or to another noun. As regards the modern languages, some of the classes of this suffix which are regarded in Sanskrit as secondary are perfectly primary, and may be so treated without any loss of clearness.

Ka is generally joined to the root by a vowel, and the terminations most in use in forming nouns which have lived on to the present day are aka, ika, uka, aka, and ūka.

Whatever may be the strict philological theory as to the origin of this ka, in practice there can be no doubt that its meaning is primarily that of "the doer." It may perhaps be supposed to be a shortened form from the root kar, " to do;" but this is a matter of Sanskrit philology, into which it is needless here to inquire. Starting from this point, however, the meaning, like all meanings in all languages, widens out and loses in distinctness as it goes on. A fourfold division may be detected, which has this advantage, that it subsists in the langauges of the present day as clearly as in Sanskrit and the Prakrits. If it be found in Sanskrit, it will of course be also found in the Prakrits, as the latter are the mere apes of the former, having no independent ideas of their own; or perhaps it would be fairer to say of them, that they are identical with Sanskrit in so far as they are the popular side of that uncient Aryan speech of which Sanskrit is the learned and literary side only. It is not till we come to the Indian renaismace in the twelfth century that we find the popular dialects possessing any originality, and striking out for themselves forms which are something more than more colloquial and phonetic corruptions of Sanskrit. When they do begin to do so, they often leave the ancient path and go into ground where it is difficult to follow them, or account for the origins of their forms. When therefore they do carry on an ancient system into modern times, it is a fact to be laid hold of and brought to the fore.

The fourfold division which I make is, then, as follows:

- (I). Words which mean purely and simply "the door:" का बारक "door," पायक "cooker," दावक "giver," नेवाक "writer."
  - (2). Words in which the sense of "the deer" is only to be

detected metaphorically: as सर्ज "a road," i.e. that which goes on and on; जोचल "pupil of the eye," i.e. that which shines or glances; पावल "fire," i.e. that which purifies; तमक "asthma," i.e. that which chokes. This class includes words which are derived from intransitive verbs, and those in which a passive sense must be substituted for that of the agent; as चिचल "leopard," i.e. the spotted animal; चातल "a pit," i.e. that which is dug; चूल "lotus," i.e. that which blooms; पुतल "birth," i.e. the act of being born.

- (3). Words which have entirely lost all idea of agency, if indeed they ever had it, and have become pure appellatives: as 我因"an army," which, if it ever had the idea of "the encompasser," from the root 我 "to surround," had lost it long before the times to which we can look buck: 夏朝"a wolf," for which we have only a dubious verbal root 夏城"to seize," which looks as if invented for the occasion; 我我 "hell," 新祖"world."
- (4). Words in which the suffix has no meaning at all, but is merely added for metrical purposes, or to avoid the intricacies of declension. This is a very numerous class, and we have side by side two forms, one with the suffix, the other without it: as कटि and कटिका "waist," कर्षड and कर्षडक "box," कांच and कांचक "black," बोच and बोचक "ball," जान and बाचक "not," तन् and तन्त "thread," and hundreds of others. It may almost be said that this suffix may be added at will to any Sauskrit noun, and in fact it would be allowable for any one who was composing or translating into that language to add the suffix to any noun he pleased, and authority would no doubt be found for any individual word in the vast stores of classical Sanskrit writings.

In the modern languages, although the same shades of meaning can easily be truced, yet as our business is rather with form than meaning, it will be more convenient to exhibit the various details of this large and important class according to its forms, alluding to the meaning of the words only where they are in any way essential to the clear perception of the subject.

(1). We has two forms.—(a). In Tatasmas it retains the k with the masculine gender, and with the sense in general of the agent, as in with "a doer." The "a taker." The "a taker." In Tadhhavas there is a numerous group of interesting words, which have come to us through the Prakrit, by virtue of the rule laid down in Book I, § 53 (3) and § 54. A single consonant in the middle of a word would be elided by that rule, and the termination akah becomes thus ao. In the moderns the a drops out and the e is retained in G, and S., but changed to a in the others. Thus we get the following:

Skr. आसनक "emblic myrobalau," Pr. आमनवी, H. आवना, P. आदळा, M. चंत्रळा, B. आयोना

Str. काटन "thorn," Pr. कंट जी. H. मारा, P. कंडा, M. कांटा, काटा, B. id., O. काटा, G. कांटी, S. कंडी

Skr. घोटन "horse,"Pr. घोडची, H. घोडा, P. M. B. O. id., S. G. घोडो Skr. चियन "leopard," H. चीता, P. चित्ता, M. चिता, B. O. id., G. चित्तो, S. चिटो and चीती-

Skr. प्रका "description," Pr. प्रको, H. पता, P. id., M. पत्ता, B. O.

Skr. पुश्चल "book," Pr. पोत्यक्षी, H. पोचा, and so in all. The fem. पोची is however more common.

Skr. माटक "hire," H. भाडा, B. O, id., P. भाडा, S. भाडी.

Shr. मस्तव "head," Pr. मंथजो, H. साथा, B. M. id., P. मत्या, S. मधो, O. सथा.

Shr. स्कोटन "tumaur," Pr. चीडची, H. फोडा, B. O. P. id.

Sindhi uses this affix, which in that language naturally results in o, as descriptive of trades or occupations. Trampp gives as examples the following, formed by Sindhi out of its own modern materials: वाडो "carpenter," verb वढणु "to cot." चीरी "sawyer," " चीरणु "to split." टोबो "diver," " दुबजु "to dive." घोरो "secker," " घुरणु "to seek."

In HIZE M. is irregular, having HIE (fem.) and HIE (n.). So also G. HIE and HE instead of HEI from HEE. M. has also contrary to rule WIE from WAIZE, but also WIEL, which, as will be shown hereafter, is from a Skr. fem. form WAIZEL. The feminines of the form in aka always end in Skr. in ikā, e.g. bālaka, "boy," bālikā, "girl." The comparative neglect by M. of the long d is possibly due to the fact that mase, nouns ending in short a, i.e. a mute, in that language, change the a to d in the oblique cases; thus from HC "a house," HCI HI "of a house," HCI HI "to a house," So that the distinction between this class of nouns and that which ends in long d exists only in the nominative, and is thus of comparatively rare occurrence.

Here also it may be admitted that, as the suffix a may be added at will to all nouns in Prakrit, it is probable that many of the nouns ending in long d or o, which I have held to be derived from Skr. oxytones, do in reality owe their final long vowel to the fact that the word from which they are derived had in popular, though not in classical usage, a a tacked on to it. This would account for Sanskrit barytones like and, becoming also, also, with long d. The difficulty, as already mentioned, is the existence of any nouns in a-m; if ka is added to all nouns of the a-stem, why do not all end in d-o?

(B). The suffix we appears also in a great many words of apparently modern origin, as well as in a few which can be traced back to Sanskrit, most of which are feminine.

<sup>&</sup>lt;sup>1</sup> This view is taken, as I have stated above, by Frof. Hoernie of Bennes, in Journ. As. Son. Bougal, vol. xii. p. 134. The learned writer is not disposed to admit with me the influence of the occur at all. There is, however, not only much that is difficult to understand in that camp, but much that requires further proof.

Some of these are pure appellatives, and if derived from Sanskrit feminines, all of which end in Tall, they must have lost the final long a, and changed the i into a, neither of which processes indeed are without a parallel, though it seems unnecessary to suppose that they have taken place here. Examples of such words are—

- H. 祝禮晴 " a road " (f.), P. M. B. O. id., G. 祝禮晴 (m.).
- H. पाटन "a gate" (m.), and so in all except S.
- H. TEG "a seat" (f.), and so in all but S. G. writes TEG.

We find in Sanskrit 电天电: and 电天电 "a read," as well as ufa, from a form of which, ufaut, or from u天电 by change of the semivowel into the media, this word may have been derived. utzu, like all the neuters of its class (see Vol. L § 80), is a formation from the rect utz "to split," "to open," though we cannot point to any actually used Sanskrit word from which to derive it. चेंद्रच is quite a modern word from the verb चेंद्रचा, concerning the origin of which see Vol. I. p. 179.

Now comes a long string of words, all feminine, which express noises, pains, violent actions, and are like our words burz, thump, crack, bang, jingle, tingle, and the like. It is almost impossible to do more in any of these cases than refer the word in a general way back to some Sanskrit root. The majority of them are in all probability onomatopoetic. As the same words do not occur in all the languages, I give each language separately, and add that every one of these words has its verb with the same meaning. I give the verb in the first few examples to show how it is formed, the reader can supply the rest for himself.

Hindi. चाटक "stoppage" (चाटका "to be stopped," चाटकाना "to restrain), जसक "pain" (जसका "to ache"), काटक "crosh" (काटका "to crash," "to fall with a crush"), जायक "sprain," खाटक "elang," चाटक "pit-a-pat," बाहक "drunkenness," "recting," बींच "starting,"

चिनक, चमक, ग्रानक, इमक, इनक, इमक, all mean "glitter," "finshing," चटक "crack," "snop," प्रिश्चक "start," श्रटक "jerk," श्रिडक "wrangling," "quarrelling," टसक "twinge," टनन "harsh sound," "cranch," टएक "throb," "drip," टहक "ache," टिउक "amaxement," टुनव "sob," टडक, घटक "trembling," इनक "rolling," "wallowing," दहन "glare," फर्क "flash," सटक "ogle," जचक "bound," "spring," जटक "hanging," "dangling," लपक "flash," "bound," खनक "gusb," "bursting," सहक "flash," "glare," सटक "tapering."

Panjabi. Many of the same words as Hindi, as बरवा. कहवा. खरवा. चिल्रक. चमका घरका झरका स्वकात स्वाका. also रणका दुवावा; and some words of its own. as विरुद्ध "filth," "seum," चिरवा "pus," "uncos," स्वका "wink," टीरवा "jogglery," "hoens-poeus," द्रवा "croaching," "shulking," धसवा "fear," "dread," सदवा "creaking" (of shoes), सववा "fondness," "petting," and others.

Sladhi does not exhibit many words of this form, owing to its invariable rule of making all its words end in a vowel. Examples are 東南電 (f.) "lustre," (司司勇 (m.) "caprice," "whim," and a few others agreeing with Hindi, as 東國司, 司和司, 司司司, 라는, that Sindhi, as will be shown bereafter, has another form for words of this class.

Marathi has झळव "glitter," तडव "bang!" "crash!" ट्वज "shock," गजन "copiousness," चटन "libing," "taste for a thing," घडन "blow," श्रिणुज "twinge," टमन "jingle," वचन nad चनन "handful," जनम "a dab," or "mass of mad," श्रिळक "a splinter," together with some of those that occur in Hindl.

Gujarathi is, like Sindhi, not very partial to this form. Instances are उसन "strut," "swagger," उत्तक "sols," उत्तक "shock," उपक "slar." "blot," चसक "glitter," शुद्धक and सुसक "glitter."

Orign and Bengali have mostly the same words as Hindi, which need not be repeated.

From the above lists have been excluded words of similar form, in which the sis organic, or a part of the root, as ZE "staring," The "shove," "parf," ZE "piece," ZHE "hindrance." But under this head come miscellaneous words like THE (m.) "square" (in all the languages), which is probably from Skr. THE H. THE "starting," as in THE TOTAL "to start up" (as a man suddenly aroused from sleep), is, it would seem, contracted from THES, a shortened form of Sanskrit THEST "surprise."

All these words being in form identical with the root of the verb, are most usually employed to form compound verbs with the addition of mini, and, ani, ten, ten or other semi-auxiliaries, especially in Hindi, as near tel "it remained hanging," that was near the horse started (from fear)," cual year fear "he dashed it against (the ground)." It is doubtful, therefore, whether in many cases they should not be rather considered as a part of the verb, than as nouns.

Sindhi, Gujarati, and Marathi, and to a less extent the other languages too, use also a closely allied form of this suffix, in which the final vowel is long, kd or ke. In many cases both forms exist, as in H. USE and USES, G. USE and USES. In Sindhi this form is the favourite, and is used almost to the exclusion of the other in . Examples in that language are the following:

उदको "fear," "dread," उबिडको "retching," उन्हो "care," "auxiety,"
कदको "crack," "crack," "thunderpeal," उदको "rattling," "pattering,"
युदको !/... गुदको "rumbling," महको "rub," चसको "fondaeus," "taste,"
क्वाको "burst," "blast," "gust," युदको !/.. सुनको "puff," दहको "boliing," "bubbling," घडको "trembling," घघको "rumbling," " rungling,"
एडको "quivering," "shivering," "roatling," एएको "bubbling,"

The other languages have also this form. Thus Hindi has used as well as uses, sawe and uses, used and uses. It is not necessary to give detailed examples, as in popular and

vulgar words like these no very strict canon is observed; sometimes one form is used, sometimes the other. In O. and B. the form in a is most common.

(2). The suffix set follows the analogy of wee. In Tatsamas it retains the set, in Tadbhavas the set goes out. Here, however, it is not left in the same condition as set, because the disappearance of the set brings into contact i and o, and later i+a. In the case of aka, the result of the elision of k was a+o and a+a, in both of which cases the short a was easily absorbed by the long vowel; i, however, resists absorption, not being homogeneous with the vowel following. What we really get is a double set of forms, of which one ends in long i t, the other in two.

Taking first the form in \$\overline{\chi}\$, we are met by the difficulty that more than one Sanskrit termination results in \$\overline{\chi}\$, at least in H. P. B. and O. For instance, there is the form \$\overline{\chi} = \overline{\chi}\$, as in Skr. Unit; which is in all Unit or Unit; and again, Skr. \$\overline{\chi} = \overline{\chi}\$ in suffice, modern with or with unit; and again, Skr. \$\overline{\chi} = \overline{\chi}\$ in suffice, modern with or with unit; and again, Skr. \$\overline{\chi} = \overline{\chi}\$ is in most cases a secondary suffix, so that a notice of it would hardly come in here. The cases I shall now give are chiefly from the Skr. fem. \$\overline{\chi} = \overline{\chi}\$, which, as mentioned above, belongs really to the \$\overline{\chi} = \overline{\chi}\$ series.

The best example of a bond-fide primary word of this form is the following:

Skr. मीतिवं "pearl," Pr. मीतिवं, मीती (m.), M. मीतीं (n.). In all the rest मीती (m.).

In M, the anuswara is a retention of the neuter form in Prakrit.

The following are from feminines in Tui:

Skr. मचिका "05," H. P. मक्ती. माही (f.), O. B. माही, M. माही, G. माखी, 8. मचि Skr. मृत्तिका "earth," H. सिट्टी, मट्टी, P. G. M., M. माती, O. B. मा-टी, S. सिटी

Sicr. 毒氧乙氧I "cucumber," H. 毒毒素], and so with slight phonetic variations, but with final f, in all.

Skr. कृशिका "key." H. B. कूंबी, P. S. M. कुंबी, G. कुंबी, O. कुंबी, O. कुंबि, जुबि

Skr. खदिका "chalk," H. खड़ी, and so in all, but O. खड़ि.

Sur. दाडिका "beard," H. G. डाडी, P. दाहडी, S. डाडही, M. दाडी, O. दाडि, B. दाडी.

8kr. बोटिका "rapesced," H. तोडी, M. तींद्या-

Here we may introduce a group of Marathi agents and adjectives, which, as derived from Tadbhava verbs, are primary, and appear to have originated from Sanskrit nouns in ika, by rejecting the k and hardening i into y. Such are—

बाइया "a barrower," verb काइयों "to extract."
ख्या "laborions," स्पूर्ण "to work."
बर्द्धा "scraper," स्ट्बें "to scrape."
बद्धा "jeweller," बह्बें "to set jewells."
टेहळ्या "prying," टेहळ्यों "to pry."

In many of these the alternative form in long i is found, as आडो, खपी, etc., and in some cases the latter is the only form in use, as भेती "owner of a field" (Skr. चिष्क), from भेत "a field" (Skr. चेप).

We may now dismiss the till we come to the secondary formations to which it more properly belongs.

- (3). 34 is exactly similar to 34 and 34, but its various forms can be truced with greater accuracy, as the vowel is not so easily confounded with other suffixes.
  - (a). The full form who is retained only in Tatsamas.
- (β). The k is rejected, together with the rowel which follows it, and the n lengthened in compensation. Words of this class.

have almost always the sense of the agent, either direct or only very slightly metaphorical. Instances are the following:

Hindl उजाइ "destroyer." verb उजादना "to destroy." उतार "apiller," उतार्वा "to cause to descend," P. id, but in sense of "degraded," M. id. "a passenger." TIZ "cutter," कारना "to cut." खाज "eater," 可可 "to ent," P. S. M. id., G. 項73 (adjective) "destructive." 「相關 "player," बेलना "to play." **UES** "watcher," - [Skr. पहर, H. पहरा"watch"]. P. ufes. #15"fighter," "beater," ... सार् ना "to strike," P. S. Id., G. साइ (adjective). डाक "caller," "robber," .. डाक्ना"to shout," P. id., O.B. डाक. धक्त "pusher," "shover," धकेलना "to shove," P. id. सवड "ascetic," "one who संबद्धना " to shave," P. Id. "a child shaves his head," whose head has been shaved for the first time." पेल "wrestler," पंत्रना "to pull," P. id. 期间 "waker," कामना "to wake," P. id.

In addition to the words noted above, Panjabi has also पाडू "tearer," पाडड "reader," जाचू "prover," "trier," दोचू "dipper,"

टालना "to cast metals," P. id.

झाडना "to sweep," and so in all.

Tantant "to spoil," P. id.

डाल "metal caster,"

MIE "sweeper," "broom,"

विवाद "speiler,"

<sup>\*</sup> Dikk is a rural form of Deknië (dassit). The word is derived from the verb "to shout," because the dassits always shout and call out at the entrance of the village they are about to plunder, whereby all the inhabitants, being terrified, hide in their houses, and the dassits, who are generally quite as afraid of the villagers as the villagers of them, can plunder the house they select without opposition.

उधान "adulterer," नवाह "lasting," from पादवा "to tear," पदहवा "to read," असवा "to test," दूबवा "to be immersed," उधानना "to abdact," "seduce" (Skr. उद्दर्श). निवाहवा "to enduro" (Skr. निवहेंवों in the sense of not + destruction). In some of these, as पादह, जानू, डोन्, the radical vowel is lengthened, or even gunatized, a practice of which more examples will be shown under the Verb.

From the habitual emission of the Gujaratis to distinguish between short and long u, it comes to pass that it is almost impossible to tell which of the words ending in u should correctly be written with long u. As each word must be considered on its own merits, the dictionary is the fit place for the discussion. The state, should probably be written with so, but in many others the point is doubtful. The difficulty is increased by the fact of the existence of the pratyaya u in Skr., which also has the sense of the agent, so that in a language which does not distinguish between the long and the short vowel, it becomes impossible to say whether we are dealing with u, or uku, or uku. The following list exhibits the most common words of the class:

बाड "eafer." Verb 福博 "to ent." गाउ "singer." " गावं " to sing," भटकु "wanderer." .. भटकवं " to wander," सर्थ "spender." .. खर्च " to spend," समञ्ज "intelligent." समजर्न "to understand," ing "cultivatur." .. चेडवं " to till," झार "broom." .. झाडवं "to sweep," चन "wanderer." .. चर्वं "to wunder,"

For this list I have to thank the Rev. I. V. Taylor, of Ahmedalad, on scenplished Gujarati scholar, and author of an excellent grammer of that horgasy, published at the Irish Mission Press, Surat, 1888. It is enfortunately written in Gujarati, so that one is expected to know the language in order to learn it?

Of these बर, सद, खाउ, बाउ, बाउ probably formed with u, and the rest with uka. The word खर्च is a hybrid from Persian "expense."

Sindhi has many examples of this form; the following are the principal:

```
तारू "swimmer,"
                           verb तर्म "to swim."
 माज "fugitive,"
                            .. Hou "to flee."
भात्र "breaker,"
                              भत्रण "to break."
साञ् "one who obeys,"
                               सञ्ज् "to'obey."
TE "dweller,"
                               रह्या "to dwell."
पह€"goat"(Le."browser"),,
                               पहर्ण "to put out (cattle) to graze."
पन् "beggar,"
                               पिनगा "to beg."
घोम् "vagabond,"
                               चुमण "to wander."
₩# "patient,"
                               सष्ट्या "to endure."
वेडह "fighter,"
                               विद्वहण "to fight."
फोड़ "robber,"
                               पुड्या " to rob."
हाज "destroyer,"
                              [Skr. हन "to kill"].
```

In the majority of cases it will be observed that the vowel of the root is lengthened or gunatized. Marathi does not employ this termination very largely, and I have not found many instances worth quoting. Nor do Bengali and Oriya much favour it: a final long vowel is in no case agreeable to the spirit of these two languages; and the forms in use belong to the next class.

Hindi has a few words of this form which are simple appellatives as far as their present use is concerned, though, perhaps, by some far-fetched and fanciful chain of metaphor, they may be capable of being resolved into agents. Such are: Skr. बालुका "sand," H. बालू, G. has also बाऊ, but O. बालि, S. बारी, B. बाली and शिल, probably from a Skr. form बालिका (see remark on वृक्षिक under इस).

Skc. अमुन, also अस्तन and असून "a hear," H. आणू, M. id., O. आनु Bhojpari Hindi per metathesis आजन, भोज-

Skr. सामक (? सामुक) "maternal nucle," H. सास. M. Id., O. सामु. but B. and P. सासा, G. and S. सामी-

(7). Especially in B. and O. the form ending in 3M (often shortened to 3M in O.) prevails, and in Hindi also this form is frequently found, particularly in words denoting occupation or trade. In Bengali it is ordinarily written 3M, but in this case, as in many others, the W is merely a fulcrum for the following vowel, and is not pronounced. In this class are included many simple appellatives, and numerous words for which it would be difficult, if not impossible, to find a Sanskrit origin. Examples are:

Bengall माङ्या "fisherman," O. माङ्या and ॰व, H. मच्या, also written मङ्वा, P. मङ्का, S. मङ्घो "a fishing-boat," G. मङ्वो id. [Probably from an unrecorded Skr. form मात्युक.]

Bengali Ngul "pimp," O. Ngul and "U. H. Ngul (chiefly as a term of abuse), M. Ngul. [The classical Skr. is 和如之, but we must suppose a form 知 or 知灵祖, from 和之 "to bire," i.q. one who bires out wuman; cf. our English whore, German Hare, Aug. Sax. hure, with hyre, hence, "reward," "bire."]

Bengull देक्या " skewer," verb देक " to stick."

Bengali 3941 "atake," verb id.

Bengali दाक्या "postman," verb दाख " to call."

Bengali चारुसा and चेरुसा "palm of hand," verb चार "to stroke," "lick." Bengali उन्नया "widower," probably connected with द्रांग "a stick," q.d. "a withered branch," "fruitless," O. द्वांगुचा. Bengali पेंद्रवा "glutton," from पेट "belly."

Dengali झानुया "pungvat sauce," verb झान् "to burn."

Bengali छानुया "cast in a mould."

Bengali छेनुया "snarling."

Bengali जानुया "watery."

Oriya has, besides those mentioned, बाळ्ब "fall of holes," from बाळ "a net;" बाड्बा "bachelor," probably from बाडि "a stick" (see दुइया above); अकुबा "a fool;" अकुबा "honeyed," from मधु "honey;" सदुवा "a drunkard," from मद "wine;" भाववा "a bearer," from Skr. मृ "to bear," मार् "a load;" बालुवा "an oil-bottle," from सव "a reed" (oil being generally carried in a joint of bamboo); बालुवा "a big nose," from बाल "nose;" देणुवा "a clod," दालुवा "a kind of rice," etc.

Many of these words are secondary forms, if we have regard to the rule which holds that only nouns derived directly from verbs are to be considered as primitives; but in words whose derivation is admittedly obscure, it seems unnecessary to keep up this distinction.

In Hindi there are often two forms of the same word, just as we saw in aka. Thus we have use and use and use and as and as an and in many cases there is only the form in ad, as in the "one who files," from the "a file," or the "to file;" use "to

चेदचा "slave," Hindl चेडा. इदचा "plough," , इस.

## बेटुका "son," Hindi बेटा: घरुका "house," , घर, स्ट.

(4). āka.—Connected with this suffix is a form āku, which appears principally in Sindhi, and to which, with elision of ₹, Trampp refers a common form in Sindhi āā, in which the final u is lengthened. It is clear, however, from the structure of other parts of words in Hindi which end in this form āā, that they are not derived from āāu, but from causal verbs, in which, as I have explained in Vol. I. ≤ 60, the aya, which is the characteristic of the causal in Skr., is changed through āu into ā, to which the long ā representing the suffix uku is appended; thus we get—

फुसनाना "to coax," 11. फुसनाक "a coaxer," "wheedler." विजाना "to feed" [caus. of खाना "to eat"], H. खिनाक "feeder."

বহাৰা "to cause to fly" [caus. of বহুৰা "to fly"], H. বহুকো

कमाना "to carn" [a quasi-causal or nominal verb from काम "work "], H. कमाक "a worker," "bread-winner," P. id., M. id.

सदाना "to make clear" [cans. of सद्दना "to see," Skr. अवर्ग], H. सदाज "an indicator," also as adj. "significant," "perceptible."

বিনাসা "to detain" [ems. of হিন্দা" to remain"], H. হিন্দান (adj.)
"durable," "stationary," P. id.

वडाना "to cause to be set" (Jewels) [caus, of वडना "to set jewels"], H. वडाक "jewelled," "studded with genus," P. id., S. id.

चटाना "to travel" [unused irreg. cans. from चाट "road"], H. चटाक "traveller," P. id.

चुलाना "to melt" [cans. of चुलाना "to be melted"], H. चुलाख "=

M. जादाज "one who is inveigled away" (wife or servant), from जादण

<sup>\*</sup> Cannal of an unused पुसल्ला " to slip," " to water," i.g. " to cause to water."

This class is exceedingly numerous, especially in H. and P.; in fact, a word of this form might be made from every causal in the language, and would probably be understood by all classes. The dictionaries do not give every word, perhaps because the compilers do not happen to have met them in writings.

Instances of nouns in du in Sindhi which Trumpp refers to dku are the following:

रहाक "dweller," from रहम् "to remain."
क्वाज "paller," " क्विम् "to pull."
विचाज "wearisome," " विचार्म "to tire."
विजाज "a destroyer," " विजार्म "to destroy."
वेवाज "salcable," " विक्रम् "to be sold."
पेटाज "an ill-wisher," " पिटम् "to corse."

Of these words, however, विदेश may be regarded as formed by uks from the causal, as the word विदेश "to be wearied," "to be tired by any one," is in use, and विदेश हुए is its causal; and the same may be suggested of most of the others. Sindhi does in many cases retain the k; as, for instance—

गिराजु "a receiver," verb गिर्सु " to take."
पिश्राजु "a drinker," ... पिश्रमु " to drink."
रहाजु "dweller," ... रहसु " to dwell."
निदाजु "sleeper," ... निद "sleep" (Skr. निद्रा).
हराजु " tamed," ... हरसु " to tame."

But there are many instances in Sindhi, in addition to those given above, in which the form dù is undoubtedly from the causal, as

नुसाज "a shirker," serb मुसादेषु "to miss," "evade," causal of गुसगु "to be missed."

<sup>&#</sup>x27;Although this verb now means "to deveur," yet its origin (from Skr. ugal) shows that it had at one time the meaning " to take," which has now attached inself to another derivative from ug, namely, in-gm.

खपाक "extravagant," verb खपाइणु " to spand," causal of खपगु " to be spent."

कुटाज "deliverer," कुटाएगु " to deliver," causal of कुटगु " to escape."

In Hindi this suffix takes usually the form  $\hat{a}k$ ; as far as my inquiries have gone, I am not aware of any forms in  $\hat{a}\hat{a}$  in Hindi which can be referred to  $\hat{a}ka$ ; they appear all to be like **QUALT**, furth, and the rest, derived from causal verbs, and the  $\hat{a}$  belongs to the verb, and not to the suffix. Instances of  $\hat{a}ka = \hat{a}k$  are the following:

Hindi WEIA "a flier," "a bird that has just begun to fly."

- .. पेराच "a swimmer."
- , इनाक "hissing sound."
- .. झडान "speed," "hurry" (literally "being swept along," from साडना "to sweep").
- .. बहाक "quarrelsome."

Most of these have also a form with the long final d, as gener, weight, and it is difficult to distinguish them from formations in which the long d represents the canaal; thus uzin and uzini "crash," asia and asiai "thud," zaia "clink," seem to be from the causals uzini, asiai, and zazaiai, where the final k represents aka, not aka; and it will be seen that the sense of agency is as much obscured in nouns of this form as it is in the cognate forms asa, aza, uza, and the like, given under aka.

Gujarati, like Sindhi, has this form in frequent use:

उद्ध्युं "to fly," उद्घाउ "one who makes the money fly," "a spendthrift,"

उक्ष्युं "to endure," उक्षाउ "enduring."

घढ्युं "to shape," घडाउ "that may be shaped or moulded."

चड्युं "to be mounted," चडाउ "rideable" (a horse).

सहयुं "to fight," सहाउ "fighter." बहुवुं "to quarrel," बहुाउ "quarrelsome" (this word is care). तपर्वे "to be hot," तपाउ and तवाउ "hot-tempered," "irritable."

The only one of the above which can be referred to uku with a causal is **ECIS**; the others have no causal sense, but are either agents, or adjectives with a secondary meaning, and in one or two cases even, as, for instance, in **UCIS**, **UCIS**, the meaning is passive, like that of the Latin part, in -ndus, as faciendus, etc.

(5). ake is a rare termination in Sanskrit, and is not traceable in any of the modern languages except Marathi and Gujarati, and in the former its presence is to be ascribed more to the habit which this language possesses, of lengthening the final syllable, concerning which see § 50.

Instances are the following :

चुमूद "sample," "taste," Skr. चूस "to select."
चेह्रक "frog." ... मण्ड्रक, i.e. मण्ड्र + ऊक.
वाचसूक "tensing," ... प्राची "to tense," Skr. याच् घटनसूक "remembering," ... घटनसे "to remember"(perhaps Skr. घटन with खा in sense of "abiding").

जागरून "wakeful," Skr. id., from जागृ + ऊक-खरवणुक "stopping," from खरवर्षी "to stop."

As this suffix is especially used in forming diminutives, it will be more appropriately considered under the head of secondary formations.

A Gujarati instance, written with the short u, is चर्नापुक "carriage," "deportment," "behaviour," from चर्नानुं "to behave," but this is evidently a modern word, probably borrowed from Marathi, and bringing with it the ए of the Marathi infinitive, which has no place in G. itself. If we derive चर्नापुक from चर्नानुं, we must treat the ए as part of the suffix, as Taylor the form of the word with the combination is that of a very modern Tadbhava, and the meaning is one of a somewhat secondary kind, so that, all things considered, the word can hardly be admitted as genuine Gujarati; and as I find no other example of the kind, I am induced to conclude that this suffix is, except in Tatsamas, confined to Marathi.

वाजुदु "a musical instrument," verls वज्रणु "to sound." वहिंदु "a beast of borden," " वहृणु "to carry."

But there are not, I believe, any parallel instances in other languages, except those already given in the First Volume.

§ 11. Much interest attaches to the stem which comes next in our list, both on account of the widespread and deepscated ramifications which it exhibits, and because one of its developments is of the highest importance in the clucidation of the mystery of genders in some of the languages. The suffix in question is technically known as ZIQ; but its effect is to add

wild to the root of a verb, so as to produce abstract nouns, or nouns denoting the idea involved in the verb; as to "to endeavour," रहा "effort." Closely connected with it is चड़also leaving WI, which only differs from ZIV in the class of verbs to which it is added, a distinction not at all important to our present inquiry, and not of very much moment even in Sanskrit. The Pandits, being rather oppressed with the amount of idle time on their hands, have employed themselves in multiplying useless distinctions, which in this busy age we are forced to disregard. The suffix &, whether technically classed as ZIU or We, is practically the feminine suffix of the majority of nouns whose masculines in a have been discussed in the preceding sections. It is important, however, to note that Sanskrit musculines in a form their feminines both in 4 and in 1; and as the rules for the adoption of the one or the other termination are somewhat intricate, dictionary-makers in most cases add the pratyaga in brackets: to wit, ZIQ or WF when the fem. is in a, when it is in I.

In Tatsamas this suffix, of course, remains, as qui "worship," चिना "thought," and the like. In Tadbhavas it is invariably shortened to a, which is, as before noted, mute for practical purposes in all the languages except Sindhi. This suppression of the long vowel is, in cases where a double consonant procedes, compensated for in the usual way by the lengthening of the preceding vowel. A few instances have been given in Vol. I. p. 182; but as the question is really one of the formation of the stem, it will be better to give a full list in this place; and as the words now quoted are of very frequent occurrence, the exhibition of a considerable number will be useful, for the sake of the individual words as much as for the rule itself. For our grammar-writers, being more of the rule-of-thumb sort of people than philologists, have, especially in Marathi, been much exercised on this point, in their endeavours to account for the fact that the majority of these words are feminine. They seem

to consider that the final consonant has been the deciding element in the matter, and lay down, or attempt to lay down, rules for each letter; as, for instance, that final z is feminine and final 3 masculine, evidently not being aware that neither 2 nor Z have anything to do with the matter, but that the words in which those letters now appear as finals are derived from Skr. words ending in d, which has been absorbed, leaving the preceding consonant, no matter what it be, as a final; and the cause of these words being feminine is not any peculiarity inberent in the consonant, which has now, as it were by accident, become final, but results from the words having been feminine in Sanskrit and Prakrit. For the rule holds good for the modern Aryan group, as well as for their Romance and Tentonic cousins, that the gender of the ancient mother speech is faithfully preserved, in spite of all changes. In German much of the difficulty which foreigners experience in determining the gender of nouns would be removed were they better acquainted with the forms of the Old High German. "Gender was, in the older language, easily recognizable from the form and method of declension of the word itself. When once we know the full Old German inflexion of a substantive, we can have no further doubt as to its gender. In our modern speech, however, these marks of gender have to a great extent been worn away and obliterated. Compare, for instance, 'der Dorn' (mase.) and 'das Horn' (neuter), 'der Wind' and 'das Land,' 'der Vogel' and 'die Nadel,' etc., with the Gothic equivalents thaurn-us and haurn, cind-s and land, fugl-s and nethia, 'der Same' (or Samen), 'die Staude' and 'das Ende,' with the Old-High-German same, study, enti." In the same way in the modern Aryan languages, our doubt as to why dant should be masculine and bat feminine is removed when we look back to the Sanskrit dant-as and earth respectively. It would be well if those who

t Heyer, Lebrhark d. Deutschen Sproche, vol. i. p. 443. Compare also the forms of the Gothic declessions at p. 96 of the same volume.

write our Indian Dictionaries for us would put the original word in a bracket for our guidance. Unfortunately they do not usually know the original themselves.

My list, which is only a specimen, and by no means exhaustive, is as follows; it consists of Skr. feminines in d, irrespective of the pratyayas by which they are considered by native grammarians to be formed:

Skr. जागा "wool," H. जन, P. उत्त, S. उन, but G. जन is n.

Skr. 책길 "bedstead," H. 책공, 책1군, P. 책공, S. 책공, G. M. 핵1군.

Shr. बीधा "Iguana," H. बोह, P. S. id., G. घो.

Skr. जंघा "leg," H. जांघ, G. M. M., P. जंघ, S. जंघ.

Skr. (1937 "tongoe," H. Will, P. G. M. Id., S. fare.

Hkr. gai "dib-grass," H. ga.

Skr. द्वाचा "vine," H. दाख. P. Id., S. डाख.

Skr. निद्रा "sleep," H. नींट्, P. Id., S. निंह, G. नींट्, M. नीट्, नीज.

Skr. पीडा "pain," H. पीड, Old-H. पीर, P. पीड, also and in the rest पीडा-

Old Hindi confounds & and T; thus Chand writes:

## को जानि मात विद्यनी पीर्॥ मीति की साल सानि सरीर॥

"Who knows, O mother! the pain of a harren woman?

The dart of a rival wife pierces the body!"—Pr. R. i. 178.

Skr. माता "mother," Old-H. मात, as in the line above quoted, ordinarily मा, माई and माउ.

Skr. माना "garland," M. and G. साटक.

Skr. रचा "ashes," H. राख. P. G. M. id., S. रख.

Skr. (USI "midon," H. (13, G. M. O. B. id., P. 43, S. 44 (see Vol. I. p. 299).

Skr. रेखा "streak," रेख, P. G. id., M. रेख, रेख.

The Sindhi Te means the first streak of down on the cheeks of a young man, and may be derived from Text, in the same sense that the Persian and Urdu poets use lest "line" in the sense of whiskers or moustache. Thus, to take an illustration from a popular Indian poet, Wali says:

"The moustache fears the mirror,
As the thiof fears the watchman."

Skr. ज्ञा "shame," H. जाज, G. M. O. and Old-B. id., P. ज्ञा, S. जञ. The form जञ्जा is also in common use.

Skr. जत्ता "kick," H. जात, B. O. M. G. id., P. जत, S. जत, B.

Skr. वस्ता "rein," H. बाब, and so in all.

## चलटी जुराक पृथिराव वाग ॥ यक्ति सुर गिग्यन धर धसत नाग ॥

"When Prithiraj the King turned rein,

The heavens stood still, the earth trembled, and the earth-serpont."

—Chand, Pr. E. xx. 35.

(सूर is for खर "heaven," शिरमन - मगन "sky," घर - घरा "earth," धमन - ध्यात "falling to pieces," and जाम is the serpent Sheshnaga, who supports the earth on his head; or we may take घर and जाम to be separated parts of a compound घरनाम "the earth-serpent.")

Skr. बाता "speech," H. बात, P. G. id., M. also, but rare, S. बाति Skr. विस्ता "ingle marmelos," H. बेज, P. M. B. O. id. Skr. शब्दा "bed," Old-H. संज्ञा, H. सेंज, P. id., G. M. भ्रेज.

Page 8, line 12, of M. Garcin de Tassy's bountiful selttion of Wall (Paris, 1924).
YOL. 10.

Skr. शाला "hall," H. साल, P. सार, G. M. शाळ, B. O. (volgarly) शाल

Skr. ग्रिमा "stone," H. सिन, P. सिळ, S. सिर, M. ग्रीळ, B. ग्रिम, O. ग्रिळ

This word in the modern languages is generally restricted to the meaning of a peculiarly shaped flat stone on which spices are ground for the native dish "curry." In Sindhi, however, it means a "brick."

Skr. गुण्डा "elephant's trunk," H. सूंड, P. सूंड, S. सूंडि, M. गुंडा, G. B. O. गुंड, G. also सुंड and सुंड.

Skr. संघ्या "evening," H. संद्र, P. संद्र, S. साद्यी, संद्र्या, but also संद्री, G. सांब, M. id., B. O. सांद्र,

Nearly all of the words in the above list retain the feminine gender throughout all the languages; but this point will be more fully dwelt on in the next chapter (see § 36).

Besides words of the class given above, there is an extremely numerous class consisting of abstract nouns, which may be formed at will from infinitives of all verbs by dropping the final syllable, and they then convey the sense inherent in the verb. Thus in Hindi HICHI "to beat," and HIC "a boating." Thus they say HE को बडी HIC HICI "he beat me a great beating." It would not be correct to say that these abstract nouns were derived from the infinitive; on the contrary, in respect of formation, they stand on the same level with it. The original Sanskrit root पीड़, for instance, forms two nouns; by adding पड़ (आ) it forms the abstract पीड़ा "pain," and by adding पड़ (आ) it forms पीड़ा "the act of paining"; from the former we get पीड़ा "pain," from the latter, पीड़ा "to pain," infinitive of the verb.

<sup>1</sup> Sec | 9, (1), (8), feminines in ab.

Some few of the commoner pairs of words may here be set down,

Hindi सार "a beating," सार्गा "to beat."

" दीड "a running," दीडगा "to run."

" भूज "an error," भूजना "to err."

" चड "a rising," चडगा "to ascend."

" चटक "a stopping." चटकगा "to be stopped."

It is these abstract nouns which are used with a long list of auxiliary verbs to make the compound verbs so common in all the seven languages, as AIX SIMMI "to kill," WE WENT "to mount upon a seat," and the like. In Sindhi all the verbs are capable of being used as abstract nouns by the rejection of the final syllable of the infinitive; as in these instances from Trumpp.1

जार "wakefulness," जारा ॥ "to be awake." सहं "pardon," सहंगु "to pardon." सघ "strength." सघगु "to be strong."

In Marathi also there are numerous abstract nouns of this sort, with which may be joined the corresponding words in Gujarati.

M. साम "adherence," सामग्री "to adhere." (). साम and सामर्थ.

" भर "fullness," भर्गे "to fill." " भर " भर्यु" सास "motion," चालग्री "to move." " सास " पानर्थ.

" धाव "running," धावश्री "to run." " धाव " धावनु (poct.).

Instances may also be found in quantities in the other languages, but it is unnecessary here to adduce them. The formation of these abstract nouns in some cases necessitates the lengthening of the radical vowel of the root, and in cases where that vowel is i or u, it is changed into the guna vowel.

<sup>1</sup> Simile Greener, p. 45.

This process is more clearly seen in Sindhi than in the other languages; thus we have—

झाट "snatching," झटगु "to snatch." भोस "error," भुसगु "to err."

Thus also in Hindi, where the verb जनना corresponds to an abstract neun लाग, and चलना to चाल; भिट्ना to भेट; and मुक्ता to चोक. As usual in these languages, there are very many of these abstract nouns which it is difficult to trace back to any Sanskrit root; the principle, however, is the same in all: when once established in the popular mind, it was by degrees extended to words in which it had no business to appear.

§ 12. The group of stems ending in i consists principally of i, ni, and ti. The former added to verbs composes abstracts or appellatives; but the final short i is in most cases rejected in the modern languages, except Sindhi. Thus, taking all three suffixes together:

Skr. ऋषि "fire," H. आग, M. G. id., P. आगा, B. आगिन and आगुन, B. आगि, O. शिश्र for अधिक.

Skr. हानि "hart," H. हान, S. हाथि, G. id. and हानी, M. हाथ।. Skr. भूमि "earth," H. भूम, भूई, मूं, P. id. and भोई, S. भू, भूई, G. भू, भोथ, भूब, M. भूब, B. भूम, O. id. and भूई.

Skr. रावि "night," H. रात. P.G. M. id., S. राति, B.O. राति and रातः

See also examples in Vol. I. p. 315, as HE, EE, EE, and the like.

Skr. भीति "song," H. गीत, and so in all, but S. भीतु (m.).

Skr. affa "custe," H. affa, and so in all, but S. B. O. affa.

Skr. wff "memory," H. P. Hen.

Skr. Afa "opinion," H. Aa, P. id., and so in all, though Afa is used in literature.

In this class also the gender depends upon that of the Sanskrit, and has nothing to do with the consonant which may happen to be left final by rejection of the vowel.

In Sindhi there is a class of words, not very extensive, formed with the suffix ti, which expresses abstract nouns, having also a verb of the same meaning. Trumpp's instances (Gr. p. 49) are:

खपति "expense," verb खपण "to spend." वणति "plensure," " वज्जु "to plense." चहति "remission," " चड्गु "to remit" (Old-H. चंडना. Mod.-H. चोडना).

इसति "behaviour," " इसमु "to go."

So also the double noun made and (literally, "coming and going") "income and expenditure."

In the other languages the short final i is generally rejected; when retained, it is mostly lengthened to I. An example of the former is the curious H. word with or with now means "brokerage," "commission." This occurs in Chand, I. 3, in the form with and with the meaning probably of "increase." There is no modern verb from which it can be derived; but it is perhaps to be referred to the Skr. root with ridh, "to increase," through a form wath. In the other languages the corresponding word is S. with (f.), G. with (f.), M. with, O. B. with

With long I we have-

H. P. चडती "profit," "rise of prices," from चडवा "to rise," M. id., U. चडती "rise," "mivance," S. चड्हति, O. चडति, B. id.

H. जगती "asserment," from जगना "to be attached," M. जगत, G. जगत (f.) "intimacy," S. जगति, B. O. जागति, जाग्ति-

H. चलती "morement," from चलना "to more," M. id. "influence," P. चझती, S. चलति "custom," "hubit," O. चलति, B. id. H. P. बसती "settlement," from चसना "to dwell," M. इसति, G. चसती. ৪. বর্মার্, with totally unralled for automore and softening of ন to হ. probably induced by a belief that the word was the feminine of the present participle active, as in English "a dwelling," O. ব্রি. B. id.

H. भरती "filling," "completion," from भरना "to fill," P. id., M. भरती, G. id., S. मधी, O. B. मर्ची.

The words of this form are not, however, universally composed by the addition of the suffix fa; for instance, H. uxil "the earth," is from Skr. uxil "the supporter." This suffix is commonly, but erroneously, added to Persian words, as "deficiency," from "less." Here may also be mentioned those two excessively common vulgarisms "jāsti" and "paramati," so perpetually in the mouths of the lower classes. Paramati, meaning "protection," "favour," is used instead of the correct Persian "correct Persian "corrected." But "jūsti," which is used instead of "correct Persian "corrected." But "jūsti," which is used instead of "corrected."

The labial vowel is found throughout every branch of these languages in strict parallelism to the palatal, here also it is so; there are stems in u, nu, tu, and ru. They present, however, no particularly noteworthy peculiarities. Common examples are as follows:

Skr. विन्दु "a drop," H. बूंद, बुंदा, बिंदी, P. बुंद, S. बुंडी, बूंद, M. बुंद, बूंद, G. बुंद, बुंदि, B. O. बिंदी.

Skr. वायु "wind," H. बाव, बाई, B. बाकी, O. बाब, M. बाव, G. दा. वाइ, S. P. बाउ.

Skr. बाह "arm," H. बांह, P. S. id., G. बांहि, M. id. and बाह. B. O. बाह.

<sup>&#</sup>x27;Volgarly used for "enlisting in a regiment," "engaging in a service," with set of of the person who hires or engages the soldier, and with start when speaking of the soldier himself.

The general rule for these groups is that the final short vowel is in a majority of cases rejected by all the languages except Sindhi; and when retained, is generally lengthened. Cases occur in which t is substituted for u, as in bindt for einels. Of the common suffix we or wig, I trent in § 16, because there are some peculiarities in its use which render it both uncertain in origin and partial in application. None of these suffixes are used in the modern languages as additions to verbal roots, so that they do not come under the head of genuine modern primaries.

§ 13. As in the case of words ending with the short vowels of the labial and palatal organs, there is a tendency to lengthen in order to preserve them, it is natural that the nouns ending in the corresponding long vowels should, as a rule, retain them. Long & is the termination of a number of different classes, which will be detailed in § 18 (I), and in the next chapter (see Chap. II. § 33), where the subject comes more fully under discussion with reference to gender. Long & û is represented in

Skr. वधु "wife," H. यह, P. बोह, M. S. यह, B. O. यह, यउ, G. यह: these three, being careless of quantity, shorten the vowel.

The monosyllable of "eyebrow," undergoes considerable changes, as H. AT. P. ATE. S. introduces its favourite i in fine, while O., on the other hand, inserts a in yea. G. Mg. M. Hat and ATE are probably derived from some formative, rather than from of itself. of "earth," has been illustrated above, under of the (§ 12).

§ 14. The termination ■ of a large class of nouns in Sanskrit, where it is preceded by a, represents an older form ■15, the 7 of which, though rejected in the Sanskrit nominative, still survives in such Old-Hindi forms as ■5,717 "a doer," and is found

in all the oblique cases of the Sanskrit noun. At p. 165 of Vol. I, these words were somewhat cursorily noticed. It may therefore be as well to examine the whole subject more fully here.

As the noun in all the modern languages takes its form from the nominative case of Sanskrit, and omits entirely the grammarian's fiction of a separate base-form, it would be expected that in this class of stems the groundwork would be the nominative in d, as sair; but this is the case, strictly speaking, only in Tatsamus. The large and important class of words denoting relationship and professions exhibits numerous different forms.

In Prakrit there are several systems; the simplest and commonest is the substitution of âre for ri, as HHICL "husband," Skr. HT. In this case the Prakrit merely perpetuates the true old Aryan nominative, rejecting the corruption which has taken place in classical Sanskrit into ri. From the analogy of the cognate forms in allied languages we see this, as Latin dator, Greek δωτήρ, which postulate a Skr. datar; the final o in Pr. arises from its custom of requiring a vowel-ending, which leads it to attach a vowel to Skr. nouns ending in a consonant (Var. iv. 6, 8), or to reject the final consonant itself. From this form arises the Old-Hindi form π(στ) quoted above, still in use in modern Panjabi π(στ) and S. πάτη.

Prakrit follows the Sanskrit in shortening the vowel in the familiar and much used words denoting relationship, fung "father," आπη "brother," जासानू "son-in-law," which stand for fung, आπς, जासानू, respectively, as is shown by their making in the other cases funger, not funger, etc. Thus also, while Lat, has dator, datorem, it has pater, patrem; and Greek δωνήρ, δωνήρα, but πανήρ, πανέρα, and πανρός; Prakrit has funct. आπιως (Var. v. 45). In these words, however, there is also the contracted form funct. आπι, and this is apparently the only form permissible in the corresponding

feminine मातृ (मातर्) "mother," which makes मात्रा. This latter is the form in use in Pali, as पिता, माता, आता.' In the oblique cases comes out a form in n, thus

Nom. Planal अनुष्यो for Skr. सर्नारः Instr. Sing. अनुष्या " अर्थाः Loc. Planal अनुष् " अर्गुष् (Var. v. 33).

This rule is not extended by Vararuchi to nouns of relationship, though in Pali the s form occurs in the genitive sing, and plur, as fugue, angue, pl. fugue, angue, occ.

There are then in the mediaval or Prakrit stage three types of this class of nouns: first, that in are, shortened in nouns of relationship to are; second, that in a; third, that in a. No one of these forms runs through the whole series, or is found in every case of the noun, except perhaps the first. When discussing the phonetic changes of # (Vol. I. p. 159), it was shown that though this vowel migrates into a but rarely, and principally in words which already have a labial consonant adjoining or preceding the vowel, yet, that in the modern, and probably to a great extent in the mediaval languages also, it was often pronounced as ru, so that we might expect to find this formation in a somewhat common in the modern languages. The Pali forms pitu, bhatu, etc., may thus be taken to have arisen from pitra, the vulgar pronunciation of pitra, though it is also possible to derive them from pitaru, shortened from pitare. This latter derivation is, however, rendered less probable by the fact that Pali has this nominative in a for words which retain the older and fuller form are, as kattu, for an "doer;" satthu, for ming "ruler," where the elision of the long vowel would seem to be too violent a supposition.

Grammaire Paile de Kaccayama, par. M. E. Senart, Journal Asiatique, sixth ser. vol. xvii. p. 220. It is Kaccayama's second chap, on nours, rule 39.

<sup>&</sup>quot; 1b. 1i. 40.

In the modern languages the termination u or  $\tilde{u}$  is common. Examples are:

Skr. पितृ "father," P. S. पिउ, and occasionally in Old-H. Skr. सातृ "mother," P. माज. मार्च. मांच. साई. मा, S. माउ. Skr. सातृ "brother," P. साच. भाज. S. भाउ. M. भाज. Skr. सपु "grandson," M. नातृ, H. नातो.

The other languages, however, have in some cases, as in H. MIZ, WIGH, etc. The word for a "barber" may be introduced here. In classical Skr. its form is WIGH, but this is said to be from an older form WIGHT for WIGHT (WIGH), agent of causal of WI, in the sense of "to cleanse." It becomes WIGHT in M., but WIZ in all the other languages, except B. and O., which retain the form WIGHT. Marathi, Sindhi, and Panjabi are, it will be seen, the languages which mostly affect this form in W. Hindi generally exhibits that in I or d. It is followed in most in the word below. Skr. WWIGHT "worshipper," H. WWIT, and so in all, M. also WWIT, and S. WWIT. The latter is referred by Trumpp, erroneously as I think, to the suffix dru (see § 15). The Prakrit form would, we may suppose, be WWWIT!

This is again one of those cases where confusion arises from three or four different pratyayas, whose forms were quite distinct in Sanskrit, having by phonetic changes all come to have the same form in the modern languages. Thus a word ending in u or u may either come from the pratyaya u, as kāru, "a doer," or from uku, as kātu, "cutter," or from ūku, as jājarū, "watchful," or from ri, as nātu, "grandson." It is not possible in each case to decide which of these terminations is the true one; and in many cases it may be safely asserted, that

In all the ceremonies of the Hindu religion in the present day a preliminary shaving by the barber is a necessary part of the purification which must be undergone by the celebrant.

s or a having come to be considered the usual termination for a large class of words of agency, the valgar tacked it on to all sorts of words, as was seen a few pages back in the case of G. 

ECH, where it is added on to the foreign word ————, without any regard to the hybrid nature of the word thus produced. This habit is common to all languages, and may be paralleled by instances in our own, as "starvation," where a Latin termination has been unceremoniously tacked on to a Tentonic verb "starve" (M. H. G. sterben). It will not be necessary therefore to pursue this question any further.

In the majority of instances the modern languages have formed words of this class from the Sanskrit nom. in 4, and in these cases there is nothing remarkable to notice. Such words are for the most part Tatsamas, and do not therefore enter into

the current speech of the people very largely.

§ 15. The dissyllabic suffixes in Skr. are athu, alu, and ishuu.
The first does not seem to have left any traces in primary stems, though under various modifications it appears as the foundation of secondary stems in several languages.

The second, dis, is extremely common, both as a primary and secondary. An allied suffix is drs, and from the close connexion between the two, it comes to pass that a form with a cerebral I is in general use in the dialects which possess that letter. Instances of primary words, according to the view of the Indian grammarians, are the following; though they seem to make into primaries, by deriving them from almost imaginary verbs, many words which are strictly secondaries derived from nouns. As I said before, it is not worth while to stick very closely to this division.

निद्रामु "sleepy," H. निद्रामु, 8. निद्रारो, G. निद्राकु, M. निद्राकु, B. O. निद्रामु (rare)-

द्यानु "mercifal," H. B. P. O. द्यानु and द्यान, M. द्याळ. द्याकू. G. id., S. ह्यानु. This termination is of frequent occurrence, and is one of those which are attached to all sorts of words, without regard to origin. The common, and often noticed rule holds good here also, that when a people have once got to feel that a certain termination carries a certain meaning, they extend its use to all words in their language. Thus, from modern verbal roots come the following:

Verbal mot समड "quarrei," H. समडालु "quarrelsome," M. G. समडाळू. P. B. O. समडालु.

Verbal root 'हर " fear," H. 'हर्1ज़ " fearfal."

Sindhi, as usual, changes I to r:

घोरारों } "pedlar," verb घोरणु "to seek." पित्रारों "cotton-carder," " पित्रणु "to card."

Marathi is particularly rich in words of this type, such as

बन्हवाळू "pitiful," verb बन्हेंसे "to mean." खात्राळु "itching," " खात्रसे "to itch."

A long string of them will be found under secondary formations.

The third suffix, ishau, is of very rare occurrence even in

Sanskrit, and I have not observed any words which can be
referred to it in the modern languages.

With regard to we, and, and we, there is also very little to be said. The first three are similar in treatment. Masculines of this stem form their nominative in d, neuters in a, the modern languages accept the nom. as their type. Thus time, "king," nom. tim, which is the form in use in all the moderns. Instances are:

Skr. नामन् "name." nom. नाम, H. नाम्, and so in all. Skr. जन्मन् "birth," nom. जन्म, H. जनम्, P. जनम्, अम्मस् Skr. पर्तन् "festival," nom. पर्त्तः, H. पर्न्, P. B. O. id., M. G. पर्व. S. पर्भे. Skr. दामन् "rope," nom. दामा, H. दाम, दान, and so in all. Skr. चर्मन् "skin," nom. चर्म. H. चाम, चरम्, and so in all. Skr. प्रमन् "love," nom. प्रेम. H. प्रेम, प्रेम, and so in all.

Nouns in to form their nominative in t, in which they are regularly followed by the moderns. As this suffix will be more fully discussed in several other places, I omit instances from this section.

§ 16. The stems, or themes, or bases, for all three terms are used by various authors, hitherto discussed, are all distinctly traceable to Sanskrit stems. But there are in the modern languages, with their rich and varied development, numerous classes of nouns whose terminations point to a common source, which yet cannot always be distinctly referred, in a manner admitting of no doubt, to either a Sanskrit or Prakrit original. Others again there are, which, though they can in some instances be brought back to Sanskrit, are only of partial application, being found in some languages, and not in others. It must be remembered that it is only in one language out of the group that any attempt has yet been made to classify or analyze these formations. In the rest the grammarians simply give rules for the declension of nouns, without troubling themselves to explain how the body of the word was formed. Only in Sindhi have the valuable labours of Dr. Trumpp put me in a position to understand the formation of the noun in this least known of all the group. Often from this exhaustive work light has shone into all the languages, and I cannot too often or too fully acknowledge my obligations to it. It follows, however, from what I have just said, that it is impossible at present for any one writer to carry out to the full the somewhat minute system of classification that has been observed in the foregoing easily recognized classes. The Indian languages in this respect fully establish a right to be considered the equals of their

Romance cousins, in the number, variety, and expressiveness of the derivatives which they have formed out of their own native resources. Frequently, too, they have adopted a form of noun from Sanskrit, and finding it useful and convenient, have extended the principle to their own Tadbhava or Desaja verbs, so that we know them only to be primaries from the existence of such verbs. All the forms that I have as yet come across I now group together in this section.

(1). ₹ is affixed to causals to denote "the wages or cost of doing anything."

Hindi घोना "to wash," causal घोलाना, nom. घोलाई "art of washing." M. धुलाई.

Hindi होना "to carry," cansal होसाना, nom. होसाई "cost of carriage."

Hindi बदना "to twist ropes," caus. बटाना, nom. बटाई "hire for making ropes."

Hindi गृहना "to bent out," caus. मृहाना, nom. गृहाई "hire for making ornaments of gold and silver."

Writers on Marathi grammar tell us that this form is only used in words of Hindi origin; but it may fairly be doubted if there be in Marathi any such thing as a word of Hindi origin. Molesworth—although he sometimes incloses in brackets the corresponding Hindi word after a Marathi one—guards his readers against supposing that the Hindi word is the original, and tells us that he merely puts down the Hindi, because it is the same as the Marathi, leaving it an open question which is the original. It is more consonant with what we know of the relations between these languages to suppose that both formed these words independently from the Prakrit. This view is further strengthened by the fact that a similar form exists in more or less frequency in all the languages of the family, except Sindhi, which expresses the idea of "wages" or "ex-

penses" by a form in well or well, as mentioned in § 6. Bengali and Oriva have numerous instances of this form, as दोलाई "cost of earringe," but in O., from some forgetfulness of the original meaning, we often hear the phonetic expression दोलाइ सर्च or दोलाइ टंका. Panjabi sometimes inserts a द. owing to the existence of this semivowel in its causal, and the same practice prevails in rustic Hindi, as चराना or चरवाना "to graze cattle;" P. H. weit or weath "wages of a herdsman or shopherd;" P. gare "cost of pulling down a building." from sqial "to demolish;" funt "wages for grinding," from पिमा बचा " to cause to grind," and many others. G. also exhibits numerous words of this type, but also expresses the idea by a form in मन्, the म of which arises from व, as in पासवं "to find," H. पाउना (Skr. प्रापत). In चरामत " wages of a hardsman," the older form would be चरावण, which is analogous to the Sindhi form in wull, mentioned above.

(2). It is employed after causals to denote an act of any kind, and is frequently written In many cases the sense would point to a derivation from the simple verb, and in these cases we must treat the termination as III, and derive it by means of the Skr. affix III or III, the III of which is preserved in Sindhi, but changed into I according to the genius of that language, and takes a feminine in I, probably from the II having been regarded as the ordinary Sindhi mase, nom. of a-stems, and not, as it really is, an organic portion of the suffix. Sindhi, however, in a few instances, rejects the I, thus coming more into conformity with the other languages.

Verbal root 可之电1 "stop," H. 有之有1日, P. 有之有1日, S. id., G. 有之电1日, M. id. and 可之电1日,

Verbal root खंच "pull," H. खिचाव, P. खिचाउ. Verbal root मना " cause to melt," H. मजाव, P. गळाउ. Verbal root घिसा "rub," H. घिसाव. Verbal root घुमा "whirl" (active), H. घुमाव, P. घुमार्ड. 1 Verbal root घढ "ascend," H. घडाव "act of ascending," "rise," P. घडडाउ, S. id., G. घडाव, M. id., but rare.

Verbal root चरा "cause to graze," H. चराव, O. चरा.

Verhal root feqt "to conceal," H. feqta.

Verbal root पद "fall," "alight," H. पदाव "encamping-ground," P. G. id., M. id. and पदांद. O. पदा.

Verbal root विक "be sold," H. विकाय "sale," O. विका.

Formations of this class are so common in Hindi, that it may be said that every verb in the language may give rise to such a noun. They are less common in the other languages. In Sindhi the examples, besides those given above, are

> घर्टु "surrounding," verb घरणु "to surround." चिमकाटु "jingling," " चिमकणु "to jingle," भृणिकाटु ) भृणिकाड

Owing to the fact that Sindhi, when it omits the \$\mathbf{Z}\$, as \$\mathbf{x} \mathbf{Z} \mathbf{q} \mathbf{q}

डराव "determination," "certainty," verb डरावर्व " to determine." मचाव "stirring up (a quarrel)," " सचावर्व " to stir up."

<sup>&#</sup>x27; In special sense of a measure of land, originally as much as could be ploughed in a day, from the bullocks survises at each end of the furrow, much as we use the word "turn" in such expressions as "a day's turn of work;" a ghamas would be "a turn of the plough."

This termination is rare in Marathi, though the syllable wing is used in the formation of secondary verbs; and it seems also foreign to the genius of B. and O. The few words that are to be found appear to have been borrowed in comparatively modern times from Hindi, such as B. चडाकी, O. चडाड, "an attack," H. चडाड; and O., as in the instances चरा, पडा, विका. given above, generally drops the final द or ड.

(3). Probably connected with the last-mentioned is the very common Hindi form in MEZ, with allied forms MEZ. ME. The fact that many of these words imply sounds of various kinds has led to the supposition that they arise from compounding the verb with the noun MEZ "noise," "sound," but this is not altogether probable. It might rather be conjectured that the process is just the reverse, and that MEZ is a mere onomatopositic word derived from the termination, on account of its having some resemblance to the sound. The word is used to express principally light and repeated noises, as "tap-tap," "pit-a-pat," and the like. The two forms, that with ₹ and that with ₹, often exist in the same word. Instances are—

Hindi खिसलाहर "slipperiness," खिसलाना "to come to slip;" खिसियाहर "frethildess," खिसियाना "to vex;" खुनलाहर "itching," खुनलाना "to itch;" घनराहर "confusion," घनराना "to be confused;" खुनलाना "to itch;" घनराहर "confusion," घनराना "to be confused;" खुनलानर "melting," धुनाना "to melt" (active); चनलावर, चमलाहर चमलाहर "splendour," चमलाना "to cause to glitter;" चुनावर "plaiting," चुना "to plait;" खुहावर "tonch," कुहना "to touch;" सुनलाहर "tinkling," धुनलाना "to tinkle;" खुनलाहर "whining," झुनलाना "to whine," धुनलाना "to tinkle;" खुनलाहर "whining," झुनलाना "to whine," "fret;" सुन्नावर "stooping," खुनलाना "to stoop." तरफडाहर "flutterlag," तन्नवहाहर "trickling," तन्नवहाहर "tingling," फडफडाहर "throbbing," are all formed from verbs of the same sound.

There is a very large class of these words in Hindi, both in that and dwaf, as well as contracted into wiz. as provide threakage," from graves to break." These forms

all run into one another to so great an extent that it is very difficult to draw the line between them. Thus from MENT "to explain," we have agree "the act of explaining," but also बद्योती, i.e. बुद्धावती, with the same meaning. The origin of these forms being unknown to the masses, it was natural that they should confuse any two of them which had at all a similar sound. Moreover there is some obscurity about the exact derivation of this and the preceding form in wid. The presence of long d does not necessarily prove that these words are taken from the causal verb in all cases. In some instances the sense leads to a derivation from the simple verb, as in usiq, usiq, which come from west, west, respectively, and not from चडाना, पदाना: The long vowel must therefore be assigned to the suffix, and in cases where the word has, on account of its meaning, to be referred to the causal, it appears that the two long vowels, that of the verbal root and that of the suffix, have coalesced into one, without any further lengthening.

Panjabi possesses a great number of words of this triple form, mostly identical with Hindi, as NATIGE, NATIGE, and NATICE. From the peculiar softness of Panjabi articulation, the g in the second form would be very indistinctly heard, so that, writing according to sounds, the third form would represent more correctly than the others the spoken word. Thus the numerals NATICE 71, NATICE 72, REC 73, NATICE 74, and the rest, sound generally ikat, bat, tet, chant. NATICE "father-in-law" is in most districts saurd. The Hindi-speaking people, on the contrary, pronounce the generally very clearly and distinctly, perhaps rather overdoing it; so that they would naturally retain the forms in MEZ, and in the eastern Hindi area MEZ, where Panjabi prefers the shortened form MIZ.

Sindhi does not appear to have any words of this form, but instances of a similar and possibly connected form will be found in § 20. Gujarati has आवत, आवट, and आट, I do not find आहट. Of the former, instances are बनावट and बनावत "fiction," बनावड़ "to make;" चाहावट "affection," चाहावं "to love;" of the latter, चळकाट "brillinney," गभराट an incorrect spelling of घवराट "confusion," गडवडाट "muddle," कणकणाट "shuddering," "tingling," etc., from verbs of similar form.

Marathi generally follows ways of its own in the numerous forms of derivatives in which it abounds; in the present instance, however, it is found to be to a limited extent in accordance with Hindi. The class of words which I am at present discussing appears in M. with the terminations we. wie: we. MIZ, and occasionally WIZI. Nouns of this class are both primary and secondary; the termination, once established, having been extended by the valgar to all sorts of words. This freedom, or rather licence of formation, is very noticeable in Marathi, which in my opinion is far richer in nominal formations than any other language of the group, and it is therefore noteworthy as a specimen of the blindness and unscientific method of the ordinary grammarians, that they either dismiss the question of stem-building without notice at all, or dispose of it in a few cursory remarks. It is really one of the most intricate and important questions of the whole subject, and if fully worked out, would demand a volume to itself.

Undoubted primary formations in M. are the following:

- बढ घसबट "the state of being much used or worked," "practice," "routine," verb धासी " to rob," Skr. घर्षेत्र.
- "to dwell," Skr. मंद्रने.
- भाजनट "act of learning the words before ploughing," verb आजी.
  " to parch," Skr. अर्जन.
- वाड विह्वड | "conduct," "management," verb बाहुगे "to earry," Skr. वहिंदाड वहने.
- WE BEVE "burnt in cooking," verb my vit "to be hurnt," Ske. wdul.

<sup>&</sup>quot; From BU in its original sees of being spealed,

- षट खबरट "troublesome," "vexntime," "vile," verb खबर्ग or खबऊमें "to sink," "fail," "misearry," Skr. खबर्ग, !
- " वावर "tough," "claumy," lit. "much chewed," verb चावर्री " to chew," Skr. चर्वर्गु.
- .. चेगरट "throng," "erowd," "crowded state of a street," verb चेगर्थों "to squeeze," Skr. —\_. "
- . चेपट "compressed," "flat," verb चेपमें " to press," Skr. (Vol. I. p. 212).
- भाट कवाट "dilemma," "scrape," "impediment," verb कवा। "to yield,"
  "fail" (orig. "to be impeded"), Skr. खंचनं "binding," "restraining," "impeding."
  - .. खडखडाठ "rattling." "grating." verb खडखडेंगे "to rattle" (unomatopoetic).
  - .. गडबहार "confusion," "bustle," "umddle," verb गडबहरी "to be in a muddle" (Vol. 1, p. 336).
- " ध्यांचवाट "a peal," "ringing," verb ध्यांचवां " to ring loudly " (onomatopoetic).
- आटा हाकाटा "bawling," "ontery," verb हाकरों " to call" (origin uncertain).

From the above examples it will be seen that M. agrees pretty closely with H., but that in several instances the form is adjectival; this peculiarity probably arises from the looseness with which these words are employed; they were originally substantives, but have passed over into adjectives by degrees.

There are words in Oriya which end in wz, but I am not

In the primary same of limping, jostling, and more generally going hadly or irregularly.

<sup>2</sup> I take this word to be a formative of a familiar character deriving its origin ultimately from the Skr. चि "to heap," substantive सद्य, perhaps with खंग "body" while, so that we should get a word चंदान for the more regular Skr. चंग्चय "errord of bodies." Inversions of this nort are common in the underse, and not unknown even in Skr.

<sup>&</sup>quot;The ordinary meaning "to drive" arms from the Indian practice of driving a level by frantic shouting and calling.

prepared to affiliate them to this stem. Of words in abut, acut, or at, I do not remember to have heard any, nor are there any instances in the dictionaries. The formation seems foreign to the genius of the language, as also to Bengali, though neither of these languages have had their depths searched out sufficiently yet, to enable a decided opinion to be given.

(4). Hindi possesses a range of words ending in \(\mathbb{U}\) and \(\mathbb{U}\) att, which, though for the most part secondary, are also in some instances primary, though comparatively rarely so. The other languages have occasional analogous forms:

महना "to mount," H. चडीत. चडीता "one who mounts." "a rider," P. चडीत. चडीत. चडीता "a mounted groom," "a trooper," M. चढाईत. चडायीत "horseman," "climber."

डाकना " to shoot," H. दुवत " robber," B. O. डाकाइत.

The origin of this form will be discussed, together with the allied forms win and wint, under the secondary formations to which it seems more specially to belong.

(5). A widely-spread group of stems is that in आवन, with variants आन, आना, and आन, which may possibly be connected with stems in ana, and differ from them only in the long vowel; while, on the other hand, the full form आवन seems to run into the pure secondary form यन, and has often a long vowel prefixed. In Benguli this form occurs as आनि, which points to the fem. अवो of other languages. I place this form among those of uncertain origin, because of the long vowel and the labial; also because, like many of the preceding stems, it occurs both as a primary and secondary in some languages. All these peculiarities throw a hase of doubt over its origin and development. Examples are as follows:

आवन (II. पहिरावन )"a garment bestowed on guests at wealings or पहिरावनी) feasts," verb पहिरामा " to clothe."

" क्यावनी "cultivating land by stealth," verb क्याना " to conceal."

यावन क्षावनी "thatching," "an encampment," verb झाना "to thatch."

" (चनावन) "despatch of goods," verb चन्नामा "to cause to go."

" वडावन "a rake of cowding used as a charm," verb इडाना

चीना विजीना "toy" (i.e. व्यक्तावना), verb व्यक्ताना "to cause to play."

" विक्रीमा "bedding," verb विक्रामा "to spread."

" Hरोना "a load of wood," verb भराना "to cause to load."

भाग छुटान "leisure," verb कुटना "to be released."

It would seem proper here also to insert the word write or wester "a wooden slipper or patten," which should probably be written write or writen from the participle writending." It possibly owes its present shape to some functed connexion or jingling with a viz "foot."

Panjabi has विकासना "bedding," विकास "toy," कास्मी "encampment," पहिनासनी "present of clothes," and in general the same words as Hindi. In Sindhi this form is secondary only. Gujarati uses a form आमना, as पेहरानची "dress given at a wedding;" वधानची "congratulation," and "congratulatory gifts," verb वधावन "to welcome;" and a contracted form in विकान or "" bedding." Instances of the Bengali form above quoted are विकान "carpet," verb विकास "to spread;" विग्रहानी "spoiling," विग्रहार "to spoil;" जहानि "interlacing," "wrapping," जहार "to wrap," "wind;" जुसहानि "packing up," जुसहाने "to pack." Oriya being in the habit of giving a sound of a to short a, uses forms विज्ञान, विक्रन, भरना, for the H. खिलीना, etc. The few words of this kind in Marathi

<sup>&</sup>lt;sup>1</sup> From its supposed efficacy in correcting the amount of grain in the heap on which it is placed (see Elliot's Races of North-West Provinces, vol. i. p. 250, my edition).

do not seem to be the genuine property of the language, and are in many instances undistinguishable from stems in -ana; they need not delay us.

- § 17. Leaving now this somewhat obscure and unsatisfactory class of words, let us go on to the secondary stems. There is a vust mass of these, and several of the purely secondary suffixes have been capriciously extended to verbs, thus bringing the words formed by them, according to our classification, under the head of primary stems. It will, however, be more convenient to treat these all as secondary, merely pointing out as they occur the instances in which they have passed over into primaries. Being all derived from nouns by the class of suffixes called Taddhita, these secondary formations fall into two great divisions: the first, those which add to a substantive or adjective a suffix which converts it into an abstract noun, descriptive of some character, occupation or quality; and the second, those which by the same process create appellatives or attributives. In this section I include only the abstract nouns.
- (1). The first I shall take is the very common suffix प्य.
  with its numerous variations. This arises from the Skr. suffix
  सं, which I have conjecturally connected with भागा "self"
  (Vol. I. p. 330), and which passes into स्वा (also नाम, Var. iv. 22),
  and, by the process described in the passage above cited of Vol. I.,
  becomes स्वम् and पाम. It has many different forms in all the
  languages, as—
  - H. पन. पना. पा-
  - P. पुरा, पुता, पता, पता,
  - ह. पण, पणी, पो, प, पाई, पी.
  - G. पण, पणं, पो-
  - M. un, uni.
  - B. पन, पाना.
  - 0. पण, पणित्र.

Examples:

Hiadi. खट्टा "acid," खटापन and oपना "acidity;" उपद्धा "sharper,"
उमझापना "sharper's tricks," "frand;" कोटा "small," कुटापा "smallness;" केन "fop," केनपन "foppishness;" बान्नव "child," बाजकपन
"childhood" (Chand बानस्पन, i.e. बानपन): बढा "great," बढापा
"greatness;" बढा "old," बुढापन and out "old age;" नढका "boy,"
जडकपन "boyhood;" जुद्धा "dissolute," नुद्धापन "dissolute living;"
रांड "widow," रांडापा "widowhood;" मूर्व "lguorant," सूरखपन
"clownishness,"

Panjabi, बुडापा, बुढेपा "ahlage;" लडकपुणा "boyhood;" उसकापुणा "finad;" सूरखपुणा "clownishness;" लुचपुणा "debanchery;" बालप्पणः "पणाः "पुणः "पुणः "childhood;" रहेपा "widowhood;" and, peculiar to itself, कुकर "boy," कुकरपुणा and कुक्हरपुणा "boyishness;" सूदह "stupid" (Skr. सूद), सूदहपुणा "stupidity;" क्षोकरा "boy," कोकरपुणा "boyhood,"

Sindhi. बुडापणु. ॰पणो. बुडापो. बुडेपो. बुडेपारं. बुडेपी. बुड्पणु.
"old age;" रन "widow," रनापणु "widowhood;" बाल "woman,"
बालपणु "womanhood;" पण्डितु "pandit," पण्डितपणी "panditship;"
बहु "seixing," बहुप "assistance;" बिट "near," बिट्य "partiality;"
बंडो "small," बंडपारं, बंडपणु, बंडेपो "youth;" बाही "watchman,"
बाहिपो, बाहिप "watchman's work;" कांधी "coffin-bearer," कांधिए,
"पणु "duties of a kandhi;" मारहे "man," मारिहपो, मारह अपणो
"humanity;" मिरू "wild beast," सिरूपणो "bestiality." These are all,
except one, from Trumpp, Sindhi Gr. p. 61.

Gujarati. Taylor's Grammar (p. 144) gives several examples which are not found in the dictionaries; but as the author is a resident of the province, he has probably heard the words from the people round him. Edoiji's Dictionary does not apparently contain more than a third of the words in the language; and Narmada Sankar's, though much fuller, does not give all the formatives, except incidentally as explanations of some other

word. The words I have found are: घरडो "eged," घरडपण, ॰पणुं "ald age;" अंधो "blind," अंधापणुं, ॰पो "blindness;" आंधळी "dark." अंधिळापणुं "darkness;" रांड "widow," रंडापो "widowhood;" बुढापो. "पणुं "old age;" खनळो "inverted," खनळापणुं "invertedness;" जुद्धापणुं "dissoluteness." The word नळापो "grief," "anxiety," "torment," seems to be derived rather from the verb चळचं "to burn" (ज्ञान) than from नळ "strength," and may be set down as an isolated instance of the use of this sumx as a primary.

Marathi. भना "good," भनेषण, "पणा "honesty:" चांगना "good," चांगलेपण, चांगलपण "goodness;" नेकंड "child;" लेंक्र्एण, "पणा "childishness;" नाकंत "a woman in childbirth," नाकंतपण "attendance on such a woman." In M. also is the softened form चण, चाण, and a form चा, ची, चें, corresponding to the UI and UI of the other languages; as from चोर "thief," चोरवण, "वाण, "वें, and चोर्वि "thierishness," or the "conduct of thieves;" सहान "small," सहानवी "smallness;" चोर् "great," धोरवी "greatness;" चार्ट "bad," वार्टपण "badness," क्यूड the grammar, but वार्ट्याणा, "थो, says the dictionary; शहाणा "wise," शहाणपण "wisdom;" स्हातारा "old," स्हातार्पण "old age." The words formed with this suffix are not given in large numbers in the dictionary, as it would appear that they can be formed at will from any adjective in the language.

Bengali. नुदापन "old age;" गुजापना, "पाना "talent,"
"virtue;" मुदापना "debanchery;" but the form, though occasionally
heard in conversation, is not very common, as Bengali has another and
commoner form in आसि for words of this class.

Origa. Words of this form, as अर्ख्यन, पागलपन, are sometimes heard, but the form does not seem to be indigenous in the language, being very rurely met with. A gennino instance is आंध्र "a rogue," आंध्र-पणिया "roguery;" also आञ्चलपणिया "the duties or profession of a Brahman," such as studying the Shistras, performing religious ceremonies,

and the like; निरिधापण "laziness;" विरुपण for विरुपपण "dissoluteness," from विरुप "dissolute."

The two points to be observed in the treatment of this stem are the method of joining it to the root, and the terminations which it takes. As to the first, if regarded as a mere pratyaya or suffix, it should in the case of Tatsamas be affixed to the bare root, so that from सूखें we should get सूख्यान = सूख्यां, and this is what does actually happen, and so far the usage is regular. But when affixed to Tadbhava adjectives which have taken the d or oxytone ending, this d would be retained, as in पदापन. in which case we must not consider the word as having been derived from the Skr. 4381, but rather thus, that the termination was regarded as a thing apart, as a sort of qualifying particle which could be appended to all adjectives at will. From the detached character acquired by this particle arises the peculiarity that it is in H. sometimes, in M. G. and S. very frequently, attached to the oblique form of the noun, because the nominative form is regarded as appropriate to that state of the noun only in which it is not subjected to any influence from without, but is either an agent or a more indication. Directly the noun becomes subject to influences of any sort, it passes into the oblique, and the addition of the syllable un, or any of its variants, was regarded as subjecting the noun to an influence somewhat similar to that exercised by the case particles, and therefore demanding the oblique form. When we see the suffix added to nouns in the direct form, it would show that in these cases the form came into existence when the suffix had not yet won its detached character; and the unsettled nature of the terminations of the root in all the languages points, in confirmation of this supposition, to a time when the languages themselves were in a transitional state, and had not attained to fixity of practice.

Equally undetermined is the termination of the suffix itself.

There are first the forms H. P. M. पन (पण, पुन) and पना, corresponding to which respectively are the S. un and unit. These two forms reproduce the barytone and oxytone forms of nouns, and if, with some writers, we derive the latter form from an addition of 3, we should have to suppose a Skr. form 34 giving Pr. THE or WHE: as however in words of the form सन्त in Sicr. the accent is on the last syllable "sattwa," it may be fairly reasoned that it would remain on that syllable in Prakrit also; and as the suffix itself has been conjectured to be shortened from wing, the form in any would be the original one, shortened as time went on into un from forgetfulness of the accent. The uncertainty in the method of affixing this ending, which is sometimes added to the direct form of nouns, and semetimes to the oblique, and at times even to a shortened form which is neither oblique nor direct, as in Sindhi, proves that words of this type came into existence at very different periods; and in those which were created in later times the accent would naturally have been forgotten, and they would take the form un.

Secondly, the forms ut and ut point to exytones, and seem to be derived from some such form as ut, emitting the ut; such a form may well have existed in spoken Prakrit, although no traces of it survive in the written works. This form would come direct from the Sanskrit at, whereas that in usu must come from an older Skr. at.

Lastly, Sindhi has forms with and wit, the final vowel of which seems to be quite inorganic, as we cannot trace it back to any corresponding peculiarity in the older forms, and is probably due to an unconscious imitation of the analogous forms are and and, which have been or will be discussed in their proper place. The Skr. word ware "self," retains the s in all cases of the sing-but the nome, and in this, as in so many instances in Skr. and the cognate languages, the nominative stands apart, and the derivative forms are taken from the oblique. Thus Greek and Latin,

while faithfully retaining the original type of us in molos, pedia, reject the d in the nominatives move and pes; yet it is from ποδος and pedia, not from πους and pes, that the derivatives are formed, as well as the noun itself, in their modern descendants. So also ocorror, dentis, reproduce दन्त more correctly than ocors or dens, and in derivatives and descendants the former, and not the latter, are the base. The reason of this is clear; the oblique form being used seven or eight times to once of the nominative, sticks in the popular mind, and is used in grammatical formations, while the classically modified nominative is forgotten-This was probably the case with the termination now under consideration; the valgar would know little of an eaphemistic high-flown nominative will, while they would be familiar with some ten or twelve forms having for their base आतान: the Old-Hindi poets use trag or trag, while the modern language does not begin to use the classical nominative CIMI till after Pandits had begun to resuscitate the accurate form. So also, while the Brahmin wrote 474, the people may have said सत्त्वन, or even सतालन, and thus the form त्त्रण or पाण reveals itself as the older and more accurate. The Till type is still in existence; in Old-Hindi we have yayıng "virility," from पुरुषत्तम, Skr. पुरुषत्व, and Sindhi has from मुखी "a headman," मुखितणु, Pr. मुखनाणं, where the S., rejecting one of the two consonants, does not, as H. would, lengthen the preceding vowel, but inserts instead its favourite short i. There may be other instances in the other languages, but I have not yet met with any. Sindhi has a few rare examples of a form in wig which

2 Dr. Trumpp will forgive me for pointing out a slight error in his English here; he trunslates this word "headman," not perhaps remembering the difference between that and "headman." The former means "an expentioner," i.e. "one who beheads criminals." Dr. Trumpp's English is so excellent, correct, and graceful throughout as to command admiration; it is in a friendly spirit that this little slip is notised, as it might minland an English student. The difference between "headman" and "headman" is slight indeed in form, but very wide in meaning.

Trumpp refers to this suffix, as wife(12 "boyhood," "youth," from wife() "a boy;" but it is open to question whether this is not the primary affix mentioned in § 16 (2), which has passed over into a secondary form in a few cases.

As a corollary to the connexion which I see between et and आत्रन, I would here introduce the Bengali stems in आसि. which I derive from was in such Skr. words as माहातम. Oriva uses HHTGH as a religious word, in the sense of "celebrating the greatness or merits of" a holy place or festival, thus we have गंगा महातम the "glories of Ganga," श्री खेतर सहातम "a description of the religious merits acquired by a pilgrimage to the shrine of Jagannath," and others. Bengali has elided the a and softened the t to T. Instances are पामन "mad," पागनामि "madness;" नुचा "debauched," नुचामि "loose living:" भाड "buffoon," भांडामि "buffoonery;" बादा "an ass," गादामि "stupidity;" उँटा "obstinate," उँटामि "obstinney;" कींचा "greedy," कींचामि "greediness;" हेचडा "base," हेचडामि "baseness:" " "proffigate" (lit. "destroyed," compare our use of "dissipated," also the original meaning of "profligatus"), नद्यान "profligacy." In familiar or colloquial words which end in a vowel other than a or d, the initial vowel of the suffix is elided; thus क्ले "a child," क्लिम "childishness;" फर्मच "an impudent boy" (French gamia), फसकेंसि "impudence;" and in vulgar speech the favourite u of Bengali exercises an influence on the following vowel; thus from que "wicked," quit "wickedness." By a carious caprice, also, a duplicate form is occasionally employed, as from बृष्ट we get ब्रह्मा "profligacy," and ब्रह्मान-Oriya also uses this form, as set "old," setfs " precedity in children;" दिला "loose,"" lazy," दिलामि "laziness," "inattention," B. id. It will be observed that this suffix is almost universally employed in a bad sense, as expressive of stapidity, loose living, or the like. One instance, जुदानि, occurs occasionally in Hindi; but, with this exception, this form appears to be peculiar to the two easternmost members of the group.

(2). Of very wide use in Sanskrit is the suffix ₹, generally neuter when forming abstract nouns, though of all genders in appellatives. This suffix generally changes to ₹ in the modern languages, and in most cases the words become feminine, owing to the general use of ₹ to express that gender. The typical word of this class is—

Skr. चीर्य "theft," Pr. चोर्य, H. चोरी, and so in all, but O, चोरि. So also

Shr. स्वार्य "cheating" (ख्रम; "a cheut"), B. द्वित्रं, H. दवी (vulgo "thuggee"), and so in all.

This termination is extended, as usual, to words of uncertain origin, and notably to Persian words, inasmuch as that language also adopts the suffix i to denote abstracts; thus we have المكن "goodness," منظري "badness," ألمن "deficiency," منظري "excess;" and even colloquially Arabic words take this ending, as "sanction," from المنظري "suen," "approved." S. has also منظري "badness," from منظري "badness," from المنظري (Skr. منظري); المنظرة "goodness," from منظرة "good" (Skr. منظري). In many cases, however, the final च of the Sanakrit is clided alogether, as in

Skr. आस्य "fortune," H. आग, and so in all. G. retains Taisama आया and S. आगु.

Skr. धान्य "rice," H. धान, and so la all, except S. धानु dhings or alleling.

This latter word seems to have been originally an abstract meaning "possessing," "wealth," root MT, as stores of rice were, and still are in many parts of India, the principal source of wealth to all classes.

Where, in modern formations, the adjective had acquired, as adjectives almost universally did, the termination in long d, the i of this suffix does not supersede this vowel, but is attached to it, forming dt. Thus we have a very large range of words in all the languages. A few areमजा "good," H. भजाई "goodness," P. भजिजाई, S. भजाई, G. M. O. M., B. भाजाई,

निर्मेला "pare," H. निर्मेलाई, and so in all.

बड़ा "great," H. बड़ाई "greatness," P. वड़ियाई, S. वड़ाई, G. B. O. id.; not in M.

जंचा "ligh." H. जंचाई "height." S. id. ("goodness"). P. उचाई. G. जंबाई. D. उचाई.

This form is not very common in M., but is of almost universal application in the rest. P. anomalously inserts short a before the termination, but this is a dialectic peculiarity which does not prevail in all parts of the province. It has already been noticed that so many Skr. terminations fuse together into t in the modern languages as to render it difficult to distinguish them. The form now under consideration is restricted to abstracts, and has no counexion with any other.

(3). The Sanakrit suffix at exists in most of the languages in a large number of words, but occurs chiefly in Tatsamas and modern Tadbhavas; so that it would be more correct to suppose that it has been resuscitated, together with the word to which it is attached, than to speak of it as having come down uninterruptedly from early times.

Skr. दृढता "firmness," H. दृढता, P. द्रिइइता, S. दिइइता. In the rest दृढता, generally pronounced drights in H., and so written also in P., but in O. it sounds draphats.

Sindhi has a few words not strictly Tatsamas, though only slightly altered, and it occasionally aids \$, making at\$, as

घटि "deficient," घटिताः घटितारे, "deficiency." स्रोम् "fit," स्रोमिता "fitnese."

In B. and M. words of this class are extremely numerous, but are all pure Tataums, and as such do not strictly some within the range of development of the modern forms of speech.

(4). Another common suffix is Enq, which is used in Bengali

in its Tatsama form, but rather among scholars than in the mouths of the people, as also in M.

रक "red," B. M. रकिमा "redness," and so in all the others, but as a rare and pedantic word.

मुख "white," B. M. मुकिसा "whiteness," and so in all the others, but as a rare and pedantic word.

Trumpp affiliates to this suffix a large class of words in S. in आणि and आइंगि, supporting his theory by allusion to Vararuchi, v. 47. This passage merely directs that certain words, such as brahman, yuvan, adhwan, are to be declined like diman; thus, camha makes ramhano; jurd, jurdno, etc. It is not, however, stated that this rule applies to formations in iman; and even granting that it does, we get imano, the change of which into dai or diai is not supported by any proof, and seems somewhat harsh, and opposed to the genius of the language. Moreover, in the closely allied and interchangeable form at, see (2), the a belongs to the adjective, and is a solitary instance of the retention of the older form of the oblique, which is still long in Gujarati, as HICT "good," obl. HICT, but has been shortened in S., as weil "white," ohl. we. In the case, therefore, of the words about to be quoted, I should say that the suffix was merely for or the primary suffix av mentioned in § 6. With this agrees the fact that the cognate languages have a form will or will, which is made only from adjectives in long d, so that the long vowel belongs to the stem. and not to the suffix. In Sindhi watfin "whiteness," from well "white," I should divide achhā-ni.

From wa, then, used as a modern suffix to adjectives which had already arrived at the stage in which they ended in long d, the following examples may be taken to have arisen:

H. कंचा "bigh," जंचान "beight," P. उद्या, उचाय, S. जची "superior," जचायि, G. जची, जंचाय.

H. चीडा "brend," चीडान "brendth," P. id.

H. স্মাতা "deep" (Old-H. উত্তা), স্মাত্তাদ, তত্তাদ, "depth," G. উত্তা, উত্তাদ

ड. वेकिरो "broad," वेकिराणि "breadth."

8. बहो "great," बहाजि "greatness."

(5), w is suffixed to a large class of adjectives in Hindi, to denote condition, and agrees with our termination "-ness." This form is connected with that of the desiderative verb in Sanskrit, and some of the words of this class cannot be regarded as formed from nouns by the addition of a suffix, but are to be derived whole as they stand from Skr. The substantive in H is accompanied by an adjective in HI, as fugit or with "thirst," fugret "thirsty," which are not to be regarded as recent formations from 41, the root of 41-11 "to drink," but as from Skr. fuguer and fugue respectively, these being the substantive and adjective from fuvia "to desire to drink," desiderative of root ut "to drink." Skr. furter loses the long final d of the fem. and becomes H. fपदास, while fuure apparently takes आ, and becomes furified, whence would come a Pr. furified, and the a vanishes, leaving H. fowier. The modern words would be more accumulatly written furth and further, as the medial u has disappeared (Vol. I. p. 199). Accordingly these words in most cases bear the meaning of "desire to do a thing," even where it is impossible or difficult to trace the word to any definite Skr. desiderative like furit. And in those words which we cannot refer to a Skr. desiderative, it must still be held that the form is in itself by nature desiderative, and having approprinted to itself this meaning, has been tacked on to modern nouns to form abstractions, so that in a number of instances it legitimately comes under the head we are now considering, namely, that of secondary abstract neurs. Examples are found of three classes: first, words derived direct from Sanskrit derivatives; second, these derived from modern verbs (primary stems); third, those derived from modern nouns (secondary stems).

Í.

Skr. पिपासा "thiest," H. पिकास (पियास, प्यास), and so in all the languages.

III.

H. रीना "to weep," रोजास "desire to weep," "vexation," P. दजास (rare).

H. मुतना "to arine," मुतास "desire to make water," P. id.

H. इंगना "cacare," ह्यास "desire to stool," P. id.

111.

Skr. निद्रा "sleep" (H. नींद्), H. नींदास, निन्हास, "denusinase."

H. ऊंच " sleepiness," ऊंघास "nodding," "incipient sleep."

H. ञ्चए "violence," H. ञ्चएास "a violent burst of rain."

H. मीडा "sweet," H. मिटास "sweetness."

Each of these words has its corresponding adjective, as पियासा, रोवासा, मृतासा, हवासा, निव्हासा, अंघासा, but not स्पास; but the stem itself is almost entirely confined to Hindi and Panjabi, only rarely occurring in the other languages, as M. बटास "sourness," from बटा "sour;" मिटास "sweetness," from सिट "sweet;" and with the short vowel मोइस "plump," from भोंडा "a swelling;" G. घोळास "whiteness," from घोळी "white;" मींडाग्र "sweetness," from मीडी "sweet;" कडवाग्र "difficulty," from aga "difficult," and a few more; and we may fairly assume that all the other words were modelled upon विश्वास, where the long a belongs to the root पा. In रोशास we cannot look back to the desiderative of Skr., which is talky, which could in no way produce roasa, but would result in some such form as ruisā. Skakespeare, in his Dictionary, absurdly derives these words by adding the Skr. WIII "hope," in which he is blindly followed by his faithful plaginrist Forbes. There are nouns with this termination which do not belong to this stem, as distent "a pole-axe," the former part of which is probably from #13 (Skr. ufag) "a knot," with some derivative

of the root wit "to cut," just as uty "an axe." The yourded is a formidable weapon of bamboo with iron knots and clamps on it, and a small axe at the head. We might assume a form usury as its origin. There is also a word given "a small turban," the former part of which is give "head," and the latter probably a derivative from usuff "to clothe," so that a form-probably a derivative from usuff "to clothe," so that a form-probably probable, the word itself grew up in modern times, and has no Sanskrit original at all.

The stems given above are the most common and widespread abstract forms. There may be in the various languages others; but they are rare and confined to special dialects, and do not require detailed notice in a work of this kind.

- § 18. The next class of secondary formations is that of adjectives denoting the possession of any article, or of any quality or tendency: the former are called possessives, the latter attributives, under which are included words denoting trades or professions.
- (1). The most important, and from its variety perhaps the most difficult to treat, of the stems of this class, is a group which has the following terminations:

Five Sanskrit stems lie beneath the threefold division which is shown by the above list;

- ) 1. इति, learing इन्, nom. ई, as मालिन् "gardener," nom. माली.
- 2. क् and क्ल, leaving र्य, as पर्तत "mountain," पर्ततीय "mountaineer."
- 3. उत्र and उन्, leaving र्क with guna, as चेद् "Veda," वेदिक "teacher of the Veda;" र्क without guna, as घट "jar," घटिक "contained in a jar."
- 4. च. leaving र्य, as राष्ट्र "kingdom," राष्ट्रिय "belonging to a kingdom."
  - 5. Several suffixes leaving य, as जन "man," जन्य "popular."

The difficulty consists, first, in the mutual interchange and fusion of these several stems, and secondly, in the fact that we cannot in all instances trace the modern word up to any distinct Sanskrit word. Of course when we can so trace it, all difficulty ceases; but there are many modern words which we can only vaguely identify with some Skr. root, but cannot tell through which of the above formations it has descended to us. A partial clae is afforded by the meaning in some cases, as the Skr. forms denote sometimes possessives, at others attributives or appellatives. But the lapse of time, the changes of meaning, and the facility with which one word lends itself to reasoning which would lead it either to a possessive or attributive origin, obscure the matter very much. I may come from 1, 2, 4 and 5 of the Skr. stems; var and its fellows from 2, 3 and 4; var can only come from 3.

It will tend to clearness to give first those words which can be traced without doubt to one definite Skr. stem, and then to discuss, as far as our present lights permit, the question of the doubtful forms.

(a). Following the order of the Sanskrit forms, we first treat of 表表, having for its nominative 表. The commonest words of this class will be found in Ch. II. § 32. Others are the following: H. डांडी and ट्रांडी "rower," from Skr. ट्रम्डी, one who uses a ट्रांड in the sense of "oar," (H. ट्रांड and डांड), P. id., M. ट्रंडी "one who carries a staff," B. O. डांडी (ddarf) "rower."

Skr. QIET "reader," "learned," H. id., O. QIET, the name of a sept of Brahmans.

Skr. विषाठी "one who has read the three Vedas," H. तेवादी, O. तिहारी, the name of a sept of Brahmans.

Skr. बेग्नरी "lion," H. बेहरी, P. बेहर, S. बेहरि, G. बेसरी.

Sicr. चेमी "prosperom," H. छेमी, and so in all.

Skr. बुडी "leprous," H. कोडी, P. कुसती, S. कोइड्डी (which points rather to a form कुछित), G. कोडिब्डी, M. कोडी, O. id. and बडी, B. कुटिया (बुडित).

Besides numerous Tatsamas in very common use in all the languages, as पापी "sinful" (पापिन), धर्मी "virtuous" (पिनिंग), रोमी "diseased" (रोगिन), and the like, S. has also ट्रांडी "complainant," from ट्रांड "complaint," which does not seem to be an Aryan word, but is probably corrupted from Arabic के "claimant," के "claim." In some cases of undoubtedly modern origin S. retains the final vowel of the original word, as मित "opinion," मतर "tenacious of one's opinion," "opinionated," where the final short i has been changed to a.

(3). The next form to is used to form principally patronymics, or adjectives denoting nationality or caste, and results in t and tor.

Skr. विश्वीय "a Sindhian," H. विश्वी, and so in all. In the same way are formed in S. जाडी "a man of जाड़ or Lower Sindh." विरादे "a man of सिरो Upper Sindh:" हिन्दूरे "that which belongs to a हिन्दू Hindû." But O. uses the form द्या, as श्रीड्या "an Oriya," from a Skr. form श्रोड्य, from श्रोड़, the old name of Bengali, "Skr. गोडीय, from श्रीड, the old name of Bengal. Common to all is मराठी or मरेडो "a Maratha," from Skr. महाराष्ट्रीय. O. has

also द्विश्या or ॰या "worthy to be offered," Skr. द्विशीय. which, however, rather means "worthy to be honoured with offerings." Further instances are:

Skr. पर्वतीय "mountaineer," H. पर्वती, पर्वतिया (chiefly used of the Nepalese), P. id. and पर्वतीचा, G. पार्वतीयो, M. B. O. पर्वतीय, O. also पर्वतियाः

Skr. देशीय "belonging to a country," H. देसी "native," as distinguished from "foreign," P. id., S. डेहाई (from डेझ) and देसी (from डेसु), G. देशी. M. देशी and देशीय. O. देशी and देशीय. B. id.

Skr. (TETH "belonging to the kingdom," B. (TET), O. H. id. This word is not known in the other provinces, and denotes a class or caste coming from the (TE, i.e. (TE), or kingdom of Bengul, that is, the settled and central parts of the country, as contrasted with the outlying and thinly peopled regions. Skr. has both forms (TETH and (TETH, but the former is commoner as a Tatsama in the moderns.

(γ). We now come to the most important of these forms, that in τε. There are two classes of this stem in Skr., one which augments the vowel of the root, the other which does not. The distinction is maintained in Sindhi with tolerable accuracy, but not generally in the others. Words of this stem are generally used as names of trades or castes.

Skr. गुण्डा "spiritnous liquor," शीण्डिक "a distiller," H. सूंडी (stiopi), B. गुंडी, O. गुंडि.

Skr. तेलं "oll," तेलिक "oilman," H. तेली, and so in all.

Skr. ताम्बूच "betel-nut," ताम्बूजिक "s seller thereof," H. तांबोजी. P. तंबोजी. G. like H., M. तांबोळी, B. O. तांबुजी.

<sup>\*</sup> Used chiefly in composition: when standing alone, it means an inhabitant of the Desk, an expression which implies the high table land of Maharashtra above the ghate or mountain range of the coast, and is opposed to Konkan, the low narrow strip of coast-line.

Skr. वेड "Veda," वैद्य "learned in the Vedas," H. वेडी.

Skr. क्रच "plant," क्यिक "grower of plants," H. क्याकी "a caste of gardeners," M. id.

Formed upon the same model are the names of three great septs of the Kanaujia Brahmans; thus दूव is shortened from इबेटी, and that is from Skr. हेबेटिन "one who knows two Vedas;" चीवे is चीवेदी, from चात्वेदिक "one who knows the whole four Vedas." The fuller form is retained in fait? "one who knows the three Vedas," Adiga. It is, however, equally correct to derive these forms from number 5 of the Skr. stems above, as in Skr. there are forms देख, देदेख, चेदेख, चार्तदेख. In the case of and, the origin of the meaning is doubtful. The Kachhis are a widespread and very industrious caste of cultivators and market-gardeners, and their name may either be due to their growing vegetables, as one of the meanings of Sanskrit क्य is "a plant," or perhaps, and on the whole more probably, from the káchh or tightly-girt and tucked-up cloth round the loins, which is the only garment that they wear. Here may, perhaps, also be classed the common word H. कुर्मी and कंबी. M. कुसूबी, the name for ordinary peasants in M., and in H. that of an extensive caste. I do not know to what Skr. word this name is to be affiliated. It is also spelt जनवी and कंशी, and the name probably originated in comparatively modern times, and may have no connexion with the older language.

Sindhi examples of this stem are:

Skr. उद्र " camel," श्रोद्रिक " camel-driver;" S. उद् " camel," श्रोदी

- S. Blat "earthenware," Blati "seller of pots."
- S. बक्द "vegetables," बाकिरी "seller of vegetables."

This last word is, I think, not Aryan, but comes from the Arabic All, "potherbs," whence the word so common in the other languages, Jul bakkal, "a vegetable-seller." In Hindu-

stani the phrase baniya bakkal is colloquially used to indicate petty traders and shopkeepers of all sorts.

(δ). The suffix द्य is hardly to be distinguished from ξα, except in words which can be traced up to the Sanskrit. The typical word is

Skr. च्या अ. Kshattriya or man of the warrior caste," H. क्यो, खबी, खेबी, P. id., S. खिबी, M. च्यी.

(e). Stems formed with 理 are very numerous, and, owing to the variations in meaning which modern words have undergone, are sometimes confounded with abstract nouns in 理, like 可允 "theft," from 可说, and, like them, frequently drop the 理 altogether. Of stems which retain 文, the following may be cited:

Skr. बाम्ब "belonging to a village," H. ब्रामी, and so in all, but H. frequently ग्रामिक and बास्य, also गांवी and गंबी, from the Tadbhara गांव। Skr. मूख "principal," H. मूखी, P. मुखी, मुखीचा, S. मुखि, G. मुखी, मृखिको, M. मुखी, B. id., O. id. and मुखिका.

A very large class of words exists in all the languages which, from the absence of any special Sanskrit form to which to refer them, or from the existence of more than one Sanskrit form, cannot be definitely referred to any of the above heads. Such, for instance, is धनी "master," "lord," also "wealthy," a word in use throughout. Skr. has धनिन, धनिन and धन. In Old B. we find the word धनिन "lady," which may either be shortened from धनिनी, or from धना.

M. is possible rich in words ending in \$1, which are perhaps generally to be affiliated to the stem in \$5, as mentioned in \$9 (2), but may also be attributed to (\$\epsilon\$) by supposing the usual addition of \$5, making \$2\$. Some of the more striking of these words are given with the Marathi primary stems to which they are allied;

ष्टत "commission," ष्टला "commission agent," "broker." ष्ट्रल "smartness," "a shock," कच्चा "smart," "sharp," "active." क्यार "scheme," क्यात्वा "scheming," " treacherous."

कंडाक "builock-pack," कंडाक्या "fit for carrying burdens," "a dranglit-horse or bullock."

कांबळा "a course blanket," कांबळखा "one who wears a kâmbaļā," "a labouring man."

कावड "pole for earrying loads," कावड्या "porter."

कोड "leprosy," कोइया "leprous."

खबळ "seab," खबळवा "scabby."

चार "ghat," चार्या "Brahman who attends at a ghilt."

सीडा "borse," घीडव्या "groom."

Here we have a curious preservation of an older form. घोडा is Skr. घोटक, Pr. घोडचो. The M. word points back to a form घोटकिया, घोटकिन or घोटका, in which the स has been preserved as a fulcrum for the termination.

Gujarati has also words of dubious origin in (4) or (4). The double form arises from the unsettled nature of G. spelling, in which no distinction is made between long and short i. The two examples most frequently given, gash "grieved," gash "happy," do not appear to come from any of the above stems, but from Skr. g:fan and gan respectively. Other instances are:

जिशाळ "school," निशाळियो "scholar" (perhaps Skr. नै:शानिक). भूमि "carth," भूमियो "carthy," O. भूया (perhaps Skr. भूमय, or भूमिक).

कोड "leprosy," कोडियो "leprous" (Skr. is कुछन्), see (a).

Without spending more time in considering the subject, it may suffice to suggest, that the fusion of several cognate forms into one, which is so common a feature in these languages, has been at work here also, and that the Skr. terminations given above may have been by careless or ignorant speakers added often to nouns which did not take such terminations in Sanskrit itself, so that words of this group may be referred at will to any of the five Sanskrit stems given, and in isolated instances to others also, as, for instance, H. fufaur "uncle," which is from none of the five stems, but from Skr. fugur.

(2). Principally indicative of qualities or dispositions of the mind is the suffix street, which, although occasionally found as a primary, is far more extensively used as a secondary suffix. Vararuchi (iv. 25) treats this suffix in Pr. as a substitute for mat (and mit), suffixes denoting possession, overlooking the fact that street exists in Skr., already. In Pr., as also sometimes in Skr., the final wis dropped. This stem is found in different words in the seven languages; each language may therefore be illustrated separately.

Marathi, in which, whether from the greater perfectness of the dictionary, or because the language is really richer in these forms, a larger number of instances has been noted than in its sisters, uses the form 知政 with the cerebral 云 and long a; it has also 知远, and occasionally even 别远, which latter points to the use of the universal আ suffix, so that we should postulate a Skr. আআৰ. There is also found আক্যা, which would indicate a former আৰক, with reference to the remarks in the concluding portion of the last section. Thus we have:

Skr. ह्रपा "pity," M. क्रपाळू, H. क्रपानु-

Skr. कप्ट "trouble," M. कप्टाक् "laborious," "painstaking."

Skr. बेग "hair," M. बेसाळ and बेसाळ "hairy,"

Skr. गुडक "ball," M. मींडा "knab," "taft," गोंडाळ "tufted grass."

Skr. [uncertain], M. Wisi "stone," visias "stony."

Skr. तुंड "snout," "beak," M. तींडा "mouth," तींडाळ "foul-mouthed," "scurrilous,"

These three are combined in a proverb descriptive of the peasant's three greatest troubles—

## गवत गाँडाळ भेत धाँडाळ बायकी तींडाळ

"Pasturage coarse and knotty, fields full of stones, and a scolding wife."

Skr. हृद्ध "hand," M. हात, id., हाताळ "thievish," "with itching palm." Another proverb runs—

## हाताळ पुरवती परंतु तींडाळ पुरवत नाहीं

"The itching palm may be satisfied, but never the scaling tengue,"
Skr. घटिका "a measure of time, about half an hour," M. घडी id.,
घडाळ "an hatrament for measuring time," "a gong," H. घडियाच,
P. id., and so in all.

Skr. घात "wound," M. घाय id., घाषाळ "wounded."

Skr. चिक्कण "greasy," M. चीक "sap," "juice," चिकाळा विकाळा and चिकाळ्या "viscid," "gennay."

Skr. [uncertain], M. श्रीप and श्रीप "sleep," श्रीपाळ "sleepy."

As to this last word, the root at in Skr. means "to move," among other things, and the root at, which is in effect an old causal of at in its meanings of "sowing (grain)," "weaving" and "sewing," shows that the movement implied by the parent root is an oscillating movement backwards and forwards, like that of a weaver's shuttle, or a sower's hand; so that we may fairly suppose it to have obtained the secondary meaning of "nodding," as one does when drowsy. In confirmation of this, M. has also and or and "a swing;" so that we may assume a form after any, which would give any, the anuswars, or rather anunasika, being inorganic. (See Vol. I. pp. 177, 327, for the anuswars, and p. 143 for the anuswars.

Shr. विधान "covering," M. ज्ञांप "a mat," श्रांपाळ "matted or bushy" (a tree); see Vol. I. p. 177. Hence is formed a verb श्रांपाळी "to be bushy and close of foliage."

Skr. समता "mineness," "selfishness," M. id., समताळू "selfish," "selfvonscions."

Skr. दुग्ध "milk," M. दूध id., दुधाळ "full of milk," "a milch com."

There are also in M. instances of this suffix taking the form

dru, as in Sindhi, thus—

M. ale "a tile," afere "tiled" (as a building).

We now pass on to Gujarati, which, like M., principally uses the 55, though words of this stem are also found with 47, but perhaps only through a mistake of the writers. Authorities disagree very widely as to the spelling of Gujarati, which is not to be wondered at in the case of a language with a scanty literature, no fixed standard of pronunciation, and numerous dialects.

- G. जाज "shame," जवाळ "shamefast," "bashful."
- G. जंच "sleep," जंघाक "drowsy."
- G. वादा "word," बामाकु "loquacious," also in a good sense "eloquent."
- G. रेती "sand," रेताक, रेताक, and by some रेताल "sandy."
- G. पथरो "stone," पखराळ "stony."
- G. सोही "blood," नोही त्राळु "bloody."
- G. हाडी "beard," दाडी आकु "bearded."
- 0. घडी "a ghari," घडी आळो "gong."

With words ending in this language affixes the termination. without modifying the stem word. In the case of nouns in a, it adds the suffix to the oblique form in a; the fem. in i is the same in the oblique as in the nominative; so that we may say that in all cases the suffix is added to the oblique form. An exception is the other languages. The language of course uses, like all its sisters, Tatsama words, at the discretion of the writer, and words like suffix are almost Tatsamas, the cerebral so being merely a vulgar pronunciation of a. This suffix is found appended even to Persian words by the indiscriminating vulgar; thus from "shame," is formed uthis or uthis "bashful."

Sindhi more frequently changes w to ₹ (Vol. I. p. 247). Thus

- S. Hig "buffalo," Hela "buffalo-berd."
- S. ঘলু "herd of cattle," ঘলাৰ "berdsman."
- S. 33 "camel," कोठाव "camel-herd."
- S. অত "barley," অব্যাল "(wheat) mixed with barley."

8. घडी "bour," घड्यानु, श्लो "gong." 8. सुडु "clouds" (callective), सहामी "cloudiness."

The final vowel, whether it be the u of the mase, or the i of the feminine, disappears before the suffix; but long i is retained, merely hardened into u, as in M. Quasi-Tatsamas also occur, which are simply due to the fact of the words being honestly written as the people pronounce them, and not as Pandits would have them; such are facing, sum, for same, sum.

The word frame "candlestick," from frait "a light," is quoted by Trumpp in this place; but it would appear to be questionable whether we have not here a compound from the Hamma. I shall show presently that compounds of this sort are not unfrequent, and often render it difficult to determine whether any word belongs to this class or not. In this and other languages compounds whose last member is time," or time," or time "ball," or time "abode," as will be exhibited hereafter, come under this category, and the confusion is increased in M. and G. by the substitution of the cerebral to for in these words, as well as in the suffix and.

Panjabi has not any special fondness for the \ sound, nor does it particularly affect stems of this formation. Instances are, उनाठा "woolken," from उन्न or उन्ना "wool!" कसाना "distressed," for कसाना, from कात "trouble" (Skr. कष्ट). In this case the possessive signification is sometimes lost, and the word used merely as an intensive substantive. केडिसाठा "thorny," from कहा "thorn" (Skr. कष्टक), where the short i represents the s of the oblique form केड. कुण्डाठा "a large earthen pot," from कुण्ड "a pot," here again intensive. चंटान (ironical) "a vain, pompous man," that is, one who has a gong beaten before him as he walks, from चंटा "a bell," "a gong." There is also, as in the above-quoted languages, the common word चंडियाज "gong," from चंडी; but the language prefers the cognate forms of this stem in it, ut, and ait, as we shall see presently.

Bengali and Oriya, being languages originally poor, and

having, therefore, a smaller stock of Tadbhavas than the others, are not fertile fields for secondary formations. In them such stems are mostly Tatsamas, like surg; and it will not be productive of any large results to adduce instances from them. The words which the student may meet with will be readily recognizable as belonging to this stem; such as, surging "quarrelsome," already cited; O. fivis "burglarious," from fiv "a burglar's hole," sometimes written fiving: are "middling," from afg (Skr. au) "middle;" farms "piercing," from fiv "a hole."

With regard to Hindi, usually so rich in primary and secondary forms, it is somewhat strange to find so few illustrations of this widespread stem. Apart from Tatsamas, it has, however, forms in dhu, and, owing to its habitual neglect of final short vowels, also dl, but displays, like Panjabi, a marked preference for the forms in il, ail, el, and ul. It also in many instances changes l to r (see Vol. I. p. 247), thus producing dr, with variants drd and dru, where the final w is preserved by being lengthened. The following list will suffice to illustrate all these forms.

H. कृष्टि "shade," कृष्टिरा "umbrageous" (not from कृष्टि + हारा, as Forbes puts it; the ह belongs to the root).

H. घडी "hour," घडियान "gong."

H. दूध "milk," दुधार "milch," and दुधाल, B. id., O. दोहल-

H. मोच "ball," गोबारा "globular,"

H. चिन्ह "mark," चिन्हार "recognition."

Skr. प्रेमन् "love," पियारा "beloved" (as though प्रिमानु for प्रे॰).

II. रेत "sand," रेतामा "sandy" (more generally रेतमा, see forther on).

Many of these words, as in the other languages, have lost the possessive or qualitative sense, and have become simple attributes.

- (3). Closely allied to the last, and like it used to express possession of a quality, is the Skr. रूज, which in Pr. often doubles the ज. making रूज. This suffix in the moderns takes a lengthened form रूजा or रूज, and combines with a preceding a or a into एज. एजा, and एज. As remarked above, it is a favourite in H. and P., though less frequent in the other languages. These two languages have forms in cla, where the a probably arises from confusion with dla, unless we here admit a change of d into c, noted as not unfrequent in Vol. I. p. 136.
  - H. गांड "knot," गडीला "knotty," P. id.
  - H. गडा "pit," गरेना "large pit" (intensive).
  - H. केकर "gravel," कंकरीला "gravelly."
  - H. UC "house," UCHT "domesticated," " tame."
  - H. घास "grass," घसीला "grassy."
  - H. घोट "wound," पुरीबा "braised."
  - H. क्व "beauty," क्वीना "beautiful." As in Bibori LaPs fanciful verses;

## नांक चठ सीवी कर जिते इबीली हैल ॥ फिर फिर भूनि उहैं गई पिय कंकरोली गैल ॥

Satteri, 284.

- H. काई "shade," कायेना "shady."
- II. देव "sting." देवीना "armed with a sting" (said of insects, as यह कीटा देवीना है "this insect has a sting").
- H. इज़ा "show," इकेनू "in the habit of butting" (said of horned animals), P. धकेनू, fem. धकेनो.
  - H. इब "form," इबीना "well-shaped," "comely,"
  - H. तोंद् "belly," तोंद्रेज "pot-bellied."
  - H. बन "forest," बनेजा "wild," "jungly."
  - H. रेत "sand," रेतीचा "sandy," "gritty."

H. बोझ "lond," बुद्धेल "load-bearing," subst. " a beast of burden."

H. सीत "rival wife" (Skr. सपती), सीतेजा "belonging to a rival wife," as in the phrase सीतेजा भाई that is, "a brother, son of the same father, but by a different mother," "a half-brother."

H. चींक "start" (Skr. चमत्कार). चींकिस "a horse that is given to shying or starting,"

There seems to be no rule for the use of one of these forms instead of another, though in practice we find that one word always uses elâ, and another ilâ, while a third has only the form ailâ. With respect to the use of the final â, it may perhaps be laid down that such words as have a distinctly adjective sense always take the final â, but such nouns as are used substantively reject it. Thus, if we should say, "he is my half-brother," we must use elâ, as allan art, but if we would say, "this man and woman are my brother and sister by the father's side, but by different mothers," we might say, "they are my santels," द्वारे संतिच है. So also derisively, "Ho, pot-belly!" would be, बढ़े तेरिज.

Those words in which Panjabi agrees with H. have been noted above; other instances peculiar to that language are these which follow. अटब in the sense of halting, gives अटबेली (f.) "a woman that walks mineingly, or affectedly," sometimes, but incorrectly, written अटबेली, possibly from some idea of its being in some way connected with अल "play." From अह "stoppage," अटल "a horse that jibs," G. अहिंग्ल.

P. 電視 "strength," "drawing-power," 電視網 "astringent" (said of medicines).

Ar. ८.र "suffocation," (in India) "rage," घुसेला "angry." घुसेल "a had-tempered person."

P. घगरा "petricoat," घगरें "a woman who wears a petricoat," i.e. a virtuous woman; prostitutes do not wear the petricoat in some parts, nor the drawers, but only the loin-cloth, alred.

P. झुंब " storm," मुंबेस subst. " quarrel," " affray," " uproar."

P. 如張! "weary," 司命術! " easily fatigued."

P. 38 " milk," 39 " a milch cow." H. has also this word.

P. पत्यर् "stone," पथरीला, पथरेला "stony."

P. बजा "shame," सजीसा "shamefast."

P. 제证 "the middle" (the name applied to the central part of the Panjab between the Ravi and Bias rivers), 克克姆 "a man from the Manjhs."

P. makes the feminines of words of the form elá in o, see Ch. II. § 33 (3). As between all and el, it may be decided that the latter is a softening of the former, which is again shortened from all आइल, where the â belongs to the root. This applies to H. also; thus क्रायेला "shady," is for क्रायेला, which is क्राया + इला. while क्रवीला is क्रिय + इला. The difficulty lies in this, that often where we have clâ, we cannot find the termination in long â in the root; thus there is no reason to believe that चन "forest," was ever चना, yet we require चना to give us चनेला, i.e. चना + इल. The rule will not therefore apply in all instances.

Sindhi has (e) and ve), but also, in conformity with its usual custom, (c) and ve). The long vowel, as in H. and P., seems to have arisen from rejection of one of the two Is of Pr. ve.

रंबो हुटु "obstinacy," हुद्वीबो "obstinate," G. id. देरो खांधि "patience," खांधीरो "patient." एको खर् "the desert," खरेखो "a man from the Thar."

, चमु "leather," चमेली "leathern." , चांव "shado," चांवेली "shady."

एरी id. चविरो id.

.. इम् "a kind of grass," द्वासरी "made of dabha grass."

With Sindhi on the one hand, and Hindi on the other, is connected in respect of this suffix Gujarati, having in some instances the same words as the former, as in waller, and in others the same as the latter, as दुधाळ = H. दुधार, also दुधेळ = H. and P. दुधेल. Its usual forms are देशो and एरो. As

नातुं "relationship," नातीचो "related, by blood or marriage." घगु "much," घगेरो "sbumiant" (only used in poetry). माठुं "bad, defective," माठेरो "scanty." घाम "sweat," घमेळो "sweaty."

The language does not seem to be rich in this class of forms. Marathi has numerous formations in in, is, and un, also in ut and ut. Care must be taken to distinguish from words of this class those words which present long i from the tendency of this language to lengthen vowels in a final syllable (Vol. I. p. 155), such as allow "perverse," "malicious," which is merely a vulgar pronunciation of Skr. allow "crooked." Further are to be eliminated a small class of compound words in which what forms the last member, as last "temple," = language also familiar words such as allow or allow "ancestor," from Skr. as through a now disused as, and arise "a wife," from ait. These seem to be a sort of diminutives.

As genuine possessives may be cited-

कड "side," "direction," कडीच "relating to a quarter or direction." खडकील "rocky." 母言唯 "rock," खाजीज "belonging to the lower part." 項T層 (ade.) "below," गोद "sweetness," गोडीक "sweetinh." कांटा "thorn," काटरा "thorny," also काटर "a thorny shrub." कांटील "a thurny creeper." id. (Skr. पुख) खा "म चेष्रेर् "divided into squares" (a cloth). division," (Sicr. खाँग) खण "an खबीन "digging up plants" (subst.). excavation," गांचा "toft," महिरा "tufted." घाणेरा "stinking," also घाणेला. WIW "stench,"

घाम "sweat,"

जुना "old,"

जुनेरे "old clothes," "rags" (subst.).

झुट "encumbrance,"

झुटेल "traublesome,"

वास "smell,"

वासरा, वासेना "feild," "rancid."

Here, as in the other languages, the meaning of the possessive has in several cases passed over into that of a substantive.

In Oriva this suffix is not common: an instance is referrally "handsome," from refer. I have not found any others, except Tatsamas. The dictionary (Sutton's), however, is a very meagre one, and I have not heard the form in speaking. The same may be said of Bengali, in which language secondary formations of all kinds are comparatively rare, or, if they exist in rural districts, are not fully recognized as other than mere local corruptions. There is a vast field for research in this direction.

(4). The combination of the suffix in with a preceding a is rare, though not altogether non-existent in Prakrit. Vararuchi gives only one instance, viarullo, for Skr. factoral "changed." The suffix as with the long vowel is found in a few cases in Skr., as argue (also argue) "mad," "gouty" (i.e. affected by wind), from ara "wind." In the modern languages it is also rare. For Sindhi Trumpp gives no examples, and does not even introduce the suffix in his very full and well-arranged list of secondary stems. There are, however, a few words which may be referred to this suffix in all the languages. Thus

Shr. बातुम "a stroke of wind," S. बाउम "blight from wind," बाउर "winnowing grain." H. बाउरा "mad" (from the meaning of Skr. बातुम given above), also written बाजजा, बावमा and बावरा. P. writes the word बाउरा, बाउरा, and बाउला. त. बाउ "foolish." M. बातुळ "flatulent," also a corrupt form बावरूळ "whiriwind." The word बाजळ, meaning "a kind of soil on the banks of rivers," seems as if it belonged to this stem; but the connexion is difficult to trace, unless it he "driven by the

wind," such as are the sand-drifts which the violent winds in the dry season heap up in the beds of rivers all over India. B. बाउडा and बाउड "mad," बाउडी "whirlwind," बाजीब "winnowing," O. बाजीका "mad."

From M. I have picked out the following, which should probably come under this head.

कुरूक "early" (tikr. कुरल). खाबोरा "gluttonous," from खार्रो "to eat," a primary formation, बाभूक "bloated," "pulpy" (like a pregnant female), from बाभ feetus.

Of more extended use are-

Skr. जाम "heat," "swent," M. चामोळी: चामोळ "prickly heat," "an eruption caused by excessive heat of the weather," H. B. चमोरी. but O. चीमर.

Skr. सथा "middle," H. सद्दोशा "middle-sized," "intermediate," P. सद्दोशा and महाळा. S. however संदारी, B. and O. सद्देशा. It is said in O. of the second of three brothers, thus बंद भाई "eldest," सद्देशा "second," कोट "youngest."

From Skr. uin in the sense of "defect," "failure," comes P. uino, uino: "lazy," "careless," not found in the other languages; also uigo "quarrel," from uit "snare," "deceit;" uigo: "dear," from uit "fondling," and some few more. H. zelu "jocose," from zel "jest." The formation is not, however, a very common one in any of the modern languages, any more than it is in Skr. or Pr.

(5). All the various forms of this group of 署 stems still further soften down to an obscure al, generally but not always preceded by y, thus giving 表明. The typical word is

Skr. घात "wound," H. घाव, M. G. id., S. P. घाउ, B. O. घा, whence comes Old-H. घाइन, H. घायन, P. G. id., P. also घाइन, S. घायनु, M. घायाळ, B. घानि, inverted from घाइन, O. id.

Here only M. has the long a, and is probably from alu, while the rest are from ila, so that they might be referred to a Skr. form चातिच, where the a has gone out as usual, and the intermediate form was probably चारिच. Panjabi has a great preference for this shortened form, owing perhaps to its fondness for short vowels and habitual neglect of the principle of compensatory lengthening. Even where a word is written with a long vowel, the Panjabi peasant will often slur it over so that it sounds short. Thus

```
बहुज "knotty." from बहु "knot."
बंधळा "muddy," "turbid," ,, बंध "filth."
धरज "cavity," "hollow," ,, धर "house."
```

इसनू for दुसरजू "belonging to the other side," दुस्सर् "the other side." They say मोली दुसनू निकळ गई "the ballet went right through, and came out at the other side."

रेतमा "sandy," , रेत "sand."
फोक्सा "insipid," , फोक "dregs."
माइका "dear," , माइ "fondling," H. माइसी.

As an instance of this form may be cited

H. अगला "foremost," "in the front," P. id., S. अन्ते "superior," G. आनल (prep.) "before," M. अगळा "superior," B. O. आगलि, to which corresponds H. पिछला "hindmost," with a similar series in the reat, as P. पिछला, etc.

Sindhi has a set of stems in iu preceded by a short vowel, which, however, do not seem to be connected with this suffix, but rather with the Skr. diminutives in  $\overline{*}$  and  $\overline{\mathsf{t}}$ , and may therefore be relegated to the section which treats of those developments.

This form is usual in Oriya, as **和**i根表 "fleshy," from **和i**根 "flesh;" **和**根表 "deceitful," from **和**根据 "a cheat."

One form fuses into another, or into several others, so constantly in these languages, that the inquirer is at every step hewildered by their similarity, and as the meanings, which are after all the safest guides, have also commonly been lost or

ahaded off by metaphors, or by local circumstances, into other classes, there is often little help to be found from them. It is probable, however, that in all except Sindhi, the group of forms in I preceded by short a has really been derived from alu, ila, or one of the cognate forms in Sanskrit; and it must be perpetually remembered that the modern languages often add a termination, which has for them acquired some special meaning, to roots and primary stems in which it does not exist in Sanskrit, or, if it existed, has not been handed down to us, so that the fact of the form itself not being found in Sanskrit is no argument against its being a genuine one for the modern vernaculars. When also the moderns tank on these expressive endings to Tadbhavas whose origin is uncertain, the inference is that they fully recognized the effect produced by such endings, and used them at will, thus constructing numerous quite recent words of their own.

\$ 19. The Sanskrit suffix \$\nsigma\_0^2\$, though in form identical with the past participle, is also largely used to form secondary nouns, originally possessive in meaning, but shading off like the other similar suffixes into attributives and mere appellatives. It is the parent of a very large range of forms in the modern languages, the most common of which is that which amalgamates the i of the suffix with the long \$a\$ of the stem, producing in H. the common form in \$ait\$, though the others frequently keep the two vowels distinct, and M. more suo lengthens \$\malepsilon\$ to \$\malepsilon\$. Hindi having got hold of \$ait\$ as a termination expressive of habitual occupation, possession or profession, adds it, regardless of etymology, to words which have no final \$a\$, shortening the long vowel of the root. Thus from

H. ढाज "shield," H. ढजित "shield-bearer," P. ढजित, M. ढाजाईत, B.

H. श्रक्ट "strut," H. श्रक्टत "a strutting, swaggering fellow," P.

More regularly, however, from words ending in å, as-

H. ऋड्खा "war-song," "pwan," कडखेत "a warrior-bard," P. id.
H. चर्चा "report," "news," चर्चेत "a gossiping person."
H. दंशा "wrangling," "affray," दंशेत "a brawler," P. id.
H. चर्छा "spear," चर्चेत "a pearman," P. id.
H. जाता "celationship," जीत "a relation."

In Sindhi this suffix is found in two forms, eto and aito. The of the former arises from the fact that this suffix is added to the oblique form of the noun, thus yz "son," oblique yz putra, whence we get putra+ito=putreto, year "having a son." In feminines in a the oblique also ends in a; thus fur "daughter," fund "having a daughter," from dhia+ito. Some words in w mase, do not change in the oblique, and in this case the w is elided; but a consciousness of its having been there prevents the i of the suffix from amalgamating with the final vowel of the root, thus will "brother," with "having a brother," for bha(u)+ito. Irregular is आएती "having a wife," from जोर "wife," where we should expect sital for joi+ito; it has probably been constructed on the model of putreto, without reflecting on the origin of the form. Another irregular word is वाटाइती "having a road," from वाट "road," which should be edleto like dhieto.

With adjectives the suffix ito is added to long a, as

वाराहती "timely," from वारी "time."
सञ्चाहतो "opportune," सञ्च "opportunity."
सृद्धाहतो "sultry," " पुट "sultriness."
निज्ञाहती "sleepy," " निज्ञ "sleep."
निज्ञाहती "regular," " नेम् "rule."

This last word is also used as an adverb "regularly," "methodically," and this is the case with several other words of this atem, in Sindhi; as चर्बाइतो "madly," from चर्बी "mad."
पत्थाइतो "respectably," ,, पति "honour."
विचाइतो "safely," ,, विची "charge," "care" (विची
"in charge of"),

Working round in our usual circle, we come next to Gujarati, which has forms in iyo produced by the rejection of the a of to. These were mentioned in § 18 (1), e. The form in ait is not given in any of the grammars or dictionaries, and does not appear to exist, though it is strange that words like atam, which breathe the spirit of the old Rajput heroes, should not have survived among the descendants of the war-like Chalukyas. Of the there are a few examples, as

बाकीख "recognition," बाकीखितो "an acquaintance." मान "honour," मानितो "respected," "a man of rank." बावा "knowledge," बावाती "skilled," "a compoissenr."

These are also written with long \$\,\text{as smelth}\$, as approach to Marathi pronunciation. In the latter language the formation in \$\,\text{\pi}\$ is common as an attributive principally: thus

कड्कड "a crackling sound," वडकडीत "that which crackles," also metaphorically "prompt," "smart."

खसखस "sound of rustling of dry grass," खसखसीत "rough," "blant," "plain-spoken."

इयादण "bang! bang!" द्यादणीत "noisy" (said of a festivity). दबद्व "squash!" दबद्बीत "soft," "polpy," "squashy."

So fond of expressive formations is Marathi, that a very long list of words of this class might be addreed; they are mostly reduplicative. Of the form with, one or two instances have been given already, as weith, similar; another is weith "one that takes the lead," from yet "front." M. and O. have from with "sword," with O. "swordsman," and with M. It would not be unreasonable to suppose that the Marathas

borrowed this word from the Oriyas; the Khandaits of Orisas formed once a very powerful and numerous body of soldiers. Under the Hindu Rajas they were the militia or landwehr of the province, and are still found as village watchmen in the South, though in northern Orissa they have beaten their swords into ploughshares, and are industrious cultivators. The khanda, or short double-edged sword, was the sign manual of the kings of Orissa, and is found rudely engraved on all their copperplate grants, thus. The Marathas may have berrowed the word during their long period of sway in that country, as it is strange that it is only found in these two languages, and has a political significance only in Orissa. O, has also

बोक्षाइत "one who collects firewood, straw, etc., for sale," from बोक्स "a bundle."

सेवाइत "a worshipper," "one who attends regularly on an idol," from सेवा "worship."

And with a further suffix aka-

पळातक "a fugitive," from पळाचन "flight," for पळाइतक-

टिकार्त "heir apparent to a throne," from टिका "the tilak or mark of sovereignty," H. टीकेत.

कटाइत "chopper," from कटान "cutting."

यन्ताइत "watchman," "guard for travellers," from अन्ता "traveller."

The gantail was a man who escorted the pilgrims to the ahrine of Jaganuath over the daugerous and difficult roads of former days. His occupation is gone in these peaceful times, but the title remains to his descendants, who are now ordinary peasants.

Bengali inverts the suffix into dtt, as in सेदाती "worshipper," for सेदाइत, but does not use many words of this stem.

Tatsamas of this form are common in all the languages, and inasmuch as its would in Prakrit drop the R and become iya, and thence I, the early Tadbhavas formed by this suffix add another element of uncertainty to the numerous words in long i in all the seven languages. This has been mentioned above under that stem.

§ 20. Most frequent in Sanskrit as a suffix indicating possession is सनुष्. This forms adjectives having for nominative मान् (m.), मती (f.), मत् (n.), also वान्, वती. वत्. In Prakrit the form becomes वसी. वसी, वसी. The Prakrit form is preserved with some modification in early Tadbhavas; but all the languages have a certain number of instances of late Tadbhavas and Tatsamas with the Skr. formation, such as धनवान "wealthy," which is in use in all. Sindhi, however, must have a vowel-ending, come what may, so it writes द्यावान "compassionate," and with very slight corruption सीचवान "virtuous," for Skr. शीखवान : विज्ञावान "learned," for Skr. विद्यावान Of early Tadbhavas with the Pr. form वन्तो, the following are examples: G. द्यावंत "pitiful," धनवंत "wealthy," सदमीवंत "prosperous" (Skr. सद्भी), सद्भावंत "bashful" (Skr. सद्भावंत), but these are not very common.

Far more general is the contracted form with exytone forms with and with. With the change of form has come a very extensive change of meaning, so that it is not easy in all cases to see by what mental process the modern signification can be traced back to the original idea of possession.

In Hindi the form in win is almost identical in meaning with that in ver, and indicates only rarely possession, as zaid, the name of a troublesome class of vagrant beggars, who in the Panjab lay claim to miraculous powers of warding off evil. They are so called from the zw., a hideous little instrument like a drum, with a bullet at the end of a string attached to it, with which they keep up a ceaseless rattle; so that the word would mean "possessing a dak," P. zwid and zwid, the latter for zwid. Less directly possessive is H. won of a wal" (Skr. www.), or "husband's elder brother," P. wal".

which, however, may be a compound from sits + ys. Hindi has a string of feminines in sital, indicating generally action, in some of which we can get the idea of possession, by treating them as adjectives compounded with a fem. substantive.

Thus avid "patrimony," "paternal inheritance," is explainable as auraal dufn "wealth possessed by, or belonging to, a father," where, however, the idea of possession is rendered passive, as we could not translate it "possessing a father," though this would be more in accordance with the original meaning. We must not be surprised at inversions of this sort in a popular and unreasoning language. Thus, for instance, the Latin suffix -bilis, which originally meant "able to do," is now generally used in the passive sense of "able to be done," amabilis, aimable, amiable, do not now mean "able to love," but "able to be loved," "that which may be loved;" and in the numerous hybrid words which we have formed by adding -able to Teutonic roots, the same rule prevails: thus we say, for instance, catable, drinkable, meaning "that which may be eaten or drunk," not "that which can eat and drink." The monstrous modern word reliable, which is creeping into our language in spite of protest, can have no meaning at all. A reliable statement means literally "a statement that can be relied," which is nonsense; we say "a statement that can be relied on," so that the word, if allowed to exist at all, should be "relionable"!

The majority of these feminines cannot well, by any inversion or supplying additional meanings, be invested with a possessive sense. They refer mostly to accounts and business, and we may supply a substantive way or are. Thus

समझोती "act of explaining," from समझाना "to explain," generally बुझीती "settlement of accounts," ,, बुझाना "to explain," seed together, P. id.

सनीती "giving security for one," # मनाना "to cause to trust," P. id., O. मनोती- चुकीती "closing an account," from चुकाना "to actile," "wind-up," P. id.

भर्तिती "payment in full," " भर "full," " complete."

Others, again, are general in meaning, and have no reference to the primitive idea of possession, as

हराती "the beginning of the ploughing season," from हल "plough" (also हरसोत).

चुनीती "act of encouraging troops," from चुनशा "to array."

हिनोती "supplication" (probably only a sulgar corruption of Skr. विनयवती प्रार्थना "modest prayer").

सगीती "flesh," "mest" (derivation meertale), P. M. id., G. साग. कुडीती "ransom," from कुडाना "to ransom."

Panjabi has also a fair number of words of this kind, mostly identical with Hindi. G. uses principally चोती and उती, as in मनोती. quoted above, समजूती "explanation." M. writes चती, as पुक्रवती, corresponding to H. चुकोती, or कत, as समजूत, H. समझौती. In B. and O. the practice of pronouncing a as o has led to the confusion of words of this form with those formed by the suffix ti. In Hindi also it is a fair presumption that many of the words just quoted may be ascribed to the suffix fa, the द of which is lengthened, as in the cases quoted in § 12. Thus words which have तो added to the root direct, are from the simple root, while those in which the तो is preceded by चो, are from the causal root, whose old form ended in âu; thus चुमोती would be for चुमाउ + ति, from चुमाउना, the older form of the causal.

Here comes in more confusion. In H. and P., and occasionally in the other languages also, are found words which we are tempted to affiliate to this suffix, but which are written with Z. It is probable that these words should have A, and the use of Z is due partly to ignorance, and partly to their having

been confounded with words of the form waz, already discussed in § 16 (3). Some are found in P. with both a and z, as in the following list:

- H. सच "true," सचीटी "truthfulness."
- H. HIW " hand," EWIZI " dexterity," P. id.
- H. हर्ना "to grasp," हरीटी "staff."
- H. सींग "horn," सिगीटी "a burnisher made of horn," P. id., "a small horn."
  - P. सिन्या "teaching" (Skr. श्रिचा) सिनीती and सिनीटी "Instruction."
  - l'. सित्र "upright," सिन्नीट "uprightness" (also सिधोती).

Under this head, and to be distinctly referred to the suffix च्ल by elision of the च, and occasional lengthening of the preceding vowel, are to be classed the following Sindhi words:

भरी "load," भर्येतु "a porter." पोद्यों "labour," (Skr. पीक्ष्यं) पोद्यंतु "labourer." दिक्रमी "debt," दिक्षकातु "debtor."

With characteristic change of  $\overline{a}$  to  $\overline{z}$ , occur several words which may with great probability be ascribed to this suffix, though Trumpp would refer them, judging apparently chiefly by their sense, to the stem in  $\overline{q}\overline{q}$  through the Pr. form  $\overline{q}\overline{q}$ . Such are

कोक्द "boy," क्रोक्सार "boyhood" (quasi Skr. शावकरवत कार्ल).

This is the only instance he gives among secondary forms. When treating of primary forms, he deduces this stem from the Skr. affix wg, as noted in § 16 (2). From my own notes I take the following:

कंघु "shoulder," कंघादु "a bullock's collar" (quasi Skr. संघयद यन "machine for the shoulder").

§ 21. Closely allied to the preceding is the Sanskrit suffix at, which is divided into two, was being added to nouns of

place to indicate attributives, as द्विशास "belonging to the South," and सप् added to indeclinables to form words implying production, as तवस "produced there."

The use of these two forms has been very widely extended in the modern languages under the form \(\mathbf{T}\), which arises naturally from \(\mathbf{R}\) (see Vol. I. p. 327). I shall show reasons in a future chapter for believing this suffix to be the origin of the Marathi genitive in \(\mathbf{T}\). At present I confine myself to the stems which it forms, merely observing that these stems are more frequent in, if not entirely confined to, Sindhi and Marathi,—a circumstance which adds confirmation to the theory of the genitive, by showing that the use of this suffix was familiar to the natives of those two provinces.

In Sindhi the suffix is preceded by t or e; the former is used where the stem is a feminine in short i, in which the long t of Sanskrit has been shortened in the primary stem, because it stands at the end of the word, but preserves its full length when the suffix is added. Thus

Skr. वेष्टी "inclesure," S. वेड्डि "thicket," "jangle," वेड्डीचो "belonging to the jangle,"

Added to masculines in o or w it takes e, the old oblique form, as

8. मोडु "village," मोडेची "belonging to the same village."

S. पाडी "quarter," पाइची "of the same quarter (of a town),"

S. uift "opposite," uital " from the other side."

Marathi does not insert any junction vowel, as

M. UT "house," UTHI "domestic."

M. व्र "above," वर्चा "superior."

M. आंत " within," आंतचा "inner."

M. yel "front," year "unterior,"

M. मार्ग "behind," मागचा "penterior."

Substantives are also formed in this way, as wind "salted food," "pickle," from way "salt." I can hardly venture so far as to say that this stem is not found in the other languages at all; for I think I have seen isolated instances in P. and G.: but I may safely say that it does not in any, except Marathi and Sindhi, attain to anything like general use. In those two languages it vindicates its claim to be considered as a descendant of stems in W, both from the phonetic consideration, and from the fidelity with which it retains the meaning of possession, combined most frequently with that of place. I cannot accept Dr. Trumpp's theory, which would connect this stem with the Skr. ika through a change of k to ch.

Ika is one of the great k group, of which so much was said under the primary stems, and which must be again introduced here, because it is extensively worked to form secondary stems. We have already seen what ika becomes as a primary among the rest, and shall not be led to suspect it of changing to ch. In Vol. I. p. 269, it was shown that this organic change, though there are traces of it in Skr. and Pr., is not by any means a characteristic feature of the modern languages, and the few instances in which it does occur are those of initials.

To come to the group in ka, which need not, however, detain us long, as in the discussion of its use in primary stems, the method of its application was explained. Of aka as a distinctly secondary form little trace, if any, exists,—that is to say, we cannot point to a class of words being either abstract nouns, possessives, or appellatives, which are evidently formed from other nouns. Of ika, in Marathi, forming nouns in Ψ1, and of its connected forms in the other languages, notice was taken in § 18 (1), γ, to which I have only to add some cases in which the Ψ is retained, as in Sindhi

वापारिको "mercantile," from वापाइ "trade." वाणिको "commercial," " वाको "shopkeeper." हारिको "rustic," " हारो "peasant." In the other languages this form is rare, and generally found in Tatsamas or very recent Tadbhavas, such as **सामाजित** in use in all, "relating to an assembly," from **समाज** "an assembly."

To is used in Sindhi to make adjectives implying habitual actions or states, thus also inhabitants of any country.

हात्रू "injurious," from हात्रि "injury," विद् "revengeful," " वेद् "revenge." हापिद् "mountaineer" " हपद् "hill." बाखिद् "s man of Bakhar," " बखद् "Bakhar."

Such secondary words of this type as exist in the other languages, as, for instance, H. T. "a glutton," from T. have been sufficiently exhibited under primaries, and need not be again referred to.

There is only one other member of the k-group which remains. Sindhi adds oko to nouns and adverbs to signify adjectives of time, as

> वरिहोको "yearly," from वरिद्ध "year." रातीको "nightly." " राति "night."

In all these cases the final vowel of the stem is rejected, and the suffix joined to the bare root.

§ 22. As we draw near to the end of this long series of stems, the illustrations become more and more confined to one or two languages, and we seem to have exhausted the powers of those members of the group which are least prolific. Marathi and Sindhi keep up the game to the last, and in this, as in all other respects, show themselves more fertile in varied developments than their sister tongues. But this fertility is not for them a legitimate cause for beasting; they are, on the contrary, suffering from an objectionable picthora of forms. Among all the vast range of secondary forms there is very little variety of meaning; the English -y, -ness, -ship, and -hood, do between them as much

work as thirty or forty different suffixes in Sindhi, and it is not pretended that each of these suffixes has in itself some subtly restricted shade of meaning which separates it from the others, and renders it in a special manner appropriate to the individual word with which it is bound up. Bengali gets on very well with one or two, and Hindi with eight or ten suffixes; but Marathi and Sindhi cannot be contented without exhibiting some suffix for each of the innumerable Sanskrit pratynyas, both kridauta and tuddhita. Under these circumstances it seems needless to wear out the reader's patience by going minutely into each one of them, more especially as some of them are of such rare occurrence as only to have a word or two apiece. I shall therefore wind up this portion of the subject by briefly enumerating, with one or two examples to each, such remaining forms as I have met with; and if the reader should be acquainted with any other forms than those I have set down-as readers acquainted with the spoken vernaculars probably will be-he will have no difficulty in determining where to place it in the general system.

The Skr. suffix सथ produces a stem in आँखी in Sindhi, as

हेडु "turmeric," हेड्रांची "coloured with turmerie."

I am unable to find any traces of this form in the other languages, except in Tatsumas. The wie dropped, giving a Pr. wal, and the w softens into anumasika, with lengthening of its vowel, which is then brought forward in order that the anumasika may be utilized in filling the hiatus. The process as a whole seems unique, though resting on phonetic changes for which there is abundant analogy.

Sindhi has also stems in irs, from the Skr. suffix ₹, in which it stands alone, as in Skr. ₹ forms diminutives, in which practice it is followed by the other languages. Sindhi, however, makes appellatives and attributives, as

Rifue " housebreaker," from Rifu "a hole made by burglars."

The same language has also a series, peculiar to itself, of stems in आणी, रूपी, अपी, which are in the main possessives. Thus

बोर "thief," चोराको "of a thief." चंदु "moon," चांडिको "moomlight." सेंद्र "merchant," सेंद्रको "of a Seth."

Connected with which are stems in dal, as patronymics, thus

आर्याणी "son of आरी."

And in tuo, as

सङ्गोजो "affianced," from सङ् "cunnexion by marriage."

To these may be added atho, perhaps from Skr. MZ:

पाकाठो "damp," from पासी " water."

And doo, from Skr. W. as

वायांसी " sandy," from वारी " sand."

As to the origin of all these forms there is much doubt. Standing so much alone as they do, and unsupported by corresponding forms in the other languages, it is difficult to know whence to trace them. Trumpp deduces the first from the Skr. suffix दूज, which, however, does not seem sufficient for the vowel-changes in 4no and 4no. The second is probably from Skr. आयोज, and the third from दूज.

There are several other forms given by Trumpp, but most of those omitted from this list are to be accounted for under the verb, and may therefore be passed over at present. The same holds good of several stems in Marathi, such as those in st.

§ 23. Some of the languages are not content with one suffix, but will take two in the same word; in this case it is generally ikα in one or other of its forms which does duty as a second

suffix. Thus in Sindhi stems dno, uno, we find subsidiary forms dniko, uniko, as

These double forms do not differ in meaning from the single forms, and it is probably to this tendency to use ika as a meaningless expletive, which recalls to us the similar habit in Prakrit of attaching a 4 to all and every Sanskrit noun at will, that we should refer a numerous class of obscure words in all the languages, in which, by the side of the regular stem, we have an augmented stem in id or ud. Thus O. uses ATMONTON for "the business of a Brahman," where we have the suffix qu augmented by इजा= इक. Rustic Hindi has इहाजिया "mileh (cow)," which is 文句 + 知可 + 文本. In the Bhojpuri dialect of Hindi the terminations id and ad are added by the vulgar to all nouns, whether primary or secondary, without altering the meaning. Other cases, where there are apparently two suffixes, would be more accurately described as compounds, where the latter member, being a verbal root, has become so common as to look almost like a suffix:

§ 24. Diminutives, as well as a nondescript class of words either contemptuous or jocose or familiar, besides jingling and fanciful formations, are very common in all these vernacular languages, and in many cases the terminations in themselves are absolutely meaningless, and incapable of being solemnly and scientifically traced back to the ancient languages. In such a maze of playful or vulgar developments it would be but waste of time to attempt an elaborate arrangement; the human mind makes a tool of the tongue, and strikes out for itself sounds which satisfy its needs without regard to grammar or etymology. It will be more useful and more interesting therefore to state what forms the languages employ, than to try and find out why they employ them.

The relative size and quality of material objects are elegantly shown in all the languages by change of gender. In this respect they agree with the old Teutonic family, and other members of the great Indo-Germanic class. Masculine nouns express objects which are large, strong, or coarse; feminine those which are small, weak, or fine; and where the neuter exists, it expresses things dull, inanimate, or sexless. This will be more fully drawn out in the next Chapter.

The commonest type of the diminutive is that which has for its characteristic the letter 3; the words of this class occasionally end in this letter simply, but more frequently take the long vowel-ending, as SI, SI, S, J. This & appears to have arisen from the Sanskrit suffix 7, which in that language also forms diminutives, and is retained under the forms TI, TI, etc., in many of the seven languages. It also occasionally modulates into w, as might be expected, and in a few rather exceptional cases, chiefly in Marathi, appears as 2. In point of meaning, this termination has a wide range, from words which are pure diminutives to those in which the sense of smallness is only to be made out by researches into the original meaning; then to those in which the idea is that of contempt or familiarity, fondness or trifling; till at last we come to words which have lost all sense of smallness, and are simple appellatives. In this last class it is often impossible, or, in the present state of the subject, very hazardous, to suggest a primitive word, from which that in actual use may have been formed. The words of this class are the pure offspring of the popular mind, and consequently, though the principle involved in their formation is the same in the whole seven, yet the speakers of each language have formed their own words separately, so that, except in closely allied languages, as Hindi and Panjabi, it is rare to find an instance running through two or more. It will, therefore, be advisable here, as it was in many of the primary and secondary stems, to take each language separately.

Sindhi is clearer in respect of this form than its sisters, having a greater number of the words of this type in use as pure diminutives, and not so many as contemptuous, familiar, or appellative terms. Trumpp gives the following:

पंधु "journey" (Skr. पद "path") पंधरी "short journey." इद "shop," इटिरी "small shop." ब्रिंडु "life," ज़िंदुरो "short life." विजु "lightning" (Skr. विद्युत), विजुरो "brief finsh of lightning."

In the case of words ending in u masc., the suffix is either added to the oblique form in a, or the final u is changed to i,—in the latter case probably from the influence of the i of the fem. termination; but where the u is the feminine ending, it remains unchanged.

Similarly, nouns in o change that letter to a or i; of the former an instance is दिंबदो "sweetheart," from दिंबो "heart;" of the latter भोजिटो "a small monkey," from भोजो "monkey."

Feminines in a and i retain those vowels unaltered; but i and i are changed to in and un respectively, or in other words the suffix is added to the oblique form, as

संधी "churning staff" (Skr. सन्य). संधिषडो "a small churning staff." भट्ट "scorpion," सटुचडी "a small scorpion."

There is also a suffix ro, joined only to adjectives in the oblique form (nouns in a make their oblique in c), to signify somewhat of the quality indicated by the primary, and corresponding to the English termination "-ish," as

> विषो "long," विषेरी "longish." षोरी "small," षोरेरो "smallish."

This latter often takes a double suffix, as within "very small."

Marathi, with its oustomary fullness of forms, has a wide

range in diminutives, and sometimes uses two to one word.

Thus:

गांठ "knot," गांठोंडे "a bundle," गांठोंडी "a small bundle," also गांठोंके, गांठोंकी

खांड "piece," खांडोडे "a small bit," also खांडोरे, खांडोळे.

थिंध "rag" (थिंधी), चिंधही "a poor rag" (contemptuously).

चाम "leather," चामेंडे "skin," "hide," चामडी "the human skin." Here the sense of diminutiveness is lost.

मांव "village," मांवर "a small village."

Skr. 1174 "young of an animal," 11741 "darling," "little pet" (said to a child).

Marathi has for adjectives also the termination wir, corresponding to Sindhi Ci. and, like it, with the union vowel e after oxytone nouns, as

मोरा "fair," "light-coloured," मोरेखा "fairish."

But it uses the form in II also for this sense, as will'EL.

The termination \$\exists{1}\$, \$\exists{2}\$, is extremely frequent in Gujarati, so much so indeed that words of this type have in many cases lost the sense of smallness, and stand alone for the primary idea, having pushed the old primary word quite out of the language; such are:

दाहाडी. दाडो "day," from दिवस, through दिहा. दहा. सोहोर्डु "face," " मुख " मुझ

That this latter word is strictly a diminutive is shown by the existence of the intermediate form neg; the original word neaning "the whole face," neg; is restricted to the sense of "mouth," and this brings it under the definition of a diminutive, because that class of words not only describes a smaller article of the same kind as the primary, but also an analogous or allied article of a pettier, narrower, or partial kind. With the pure sense of diminution are found the following words in ordinary use:

गामहुं "hamlet," from गाम "village."
घाटही "small bell," ... घाट "bell."
विवही "little darling." ... जीव "life," P. जिउही.
मुख्दी "somewhat hungry." ... भूखी "hungry."
पूजगढी "a amall bedstead." ... पूजग "bedstead" (Shr. पूर्यंक).
वरागही "a ruscally sham hermit," ... वरागी "an ascetic."
महादेवडी "a trumpery old idol," ... महादेव "an idol of Siva."

These last two are contemptuous, a very common use of the diminutive in all languages. Familiar and slightly contemptuous, but at times with somewhat of a kindly meaning, are:

> यायडी "a wife," from बाद "lady." भादडी "husband," " भादे "brother" (used as a respectful term to males).

These two words correspond to the vulgar English "the master," and "the missis" (mistress), or to the rustic terms "the good man," "the good wife," as in the Marathi arts.

राखोडी "ashes," "robbish," from राख "ashes." दोरडी "a string," "दोर "a rope." शेरडो "a footpath," "शेरी "street."

As in Marathi, so also here, the termination जो (Sindhi रो) is used as a diminutive, thus :

चाइनी "a small crescent used as an ornament," from चांद् "moon" (Grock μηνίσκος, Latin lunula).

पारली "a small writing-board," from पारी "plank."

Hindi and Panjabi go together; and Gujarati, in virtue of its position as an isolated dialect of Old-Hindi, exhibits often the same words. In the first-named language the tendency, already mentioned, to express smallness by changing a masonline word into a feminine, operates to reduce the number of diminutives of the type II, and a large proportion of the words of this type are now simple appellatives with no special sense of smallness. Common to nearly all the languages are the following words of this class, whose meaning is in most cases somewhat obscured.

H. झोंपडी "hut," "hovel," P. झोंपडी, G. झुपड़े, M. झोंपडी, छोंपडे. O. झुंपडी, B. झुपडो. The primary word झोंप is not, as far as I know, in use, but it is probably connected with झांप "covering."

H. THET "leather," literally, "a small place of skin" (see Vol. I. p. 345), found in all.

H. Dicat "boy," Skr. 和何章 "young of an animal," perhaps already a diminutive from 何句 "body" (see Vol. I. p. 261, for the numerous modern forms of this word).

H. 記載計 and 記載前 "a wafer," "a small round cake," probably a diminutive of 記載 "this round sectorial mark which Hindus paint on their foreheads;" this word is derived from Skr. 行意報 (see Vol. I. p. 226), which again seems to be a diminutive from 行意 "a grain of til seed." In P. and G. 記憶計, 記憶計, 記憶計, means "a small round hillock;" and in the various meanings given to the cognate words in the other languages we may detect as a general thread of meaning running through them all that of any small round object, as "a mound," "lump," "cake," "wafer," "piece of broken pottery," and the like.

H. Elwel "a ragahand flom,"

from TH "an impure caste."

H. 信爾者 "lazy,"

.. Cimi "alack,"

H. गउरी "bundle,"

" 413 "knot."

H. was "fishbook" (small book),

" wa "hook."

H. पंचडी "glance of the eye,"

.. 現框 "eye."

H. WZIT "amall upper room,"

" WET "upper room,"

H. संस्कृत "small or bad egg."

" बण्डा "egg."

H. खनडा "skin,"" hide "(contemptuous) ..

.. खाल "skin."

H. दुकडा, ॰डी "small piece."

.. देख "piece" (Skr. स्तीम).

In some of these, in Hindi fashion, ₹ and ₹ are interchange-

able, and additional emphasis is given to the idea of smallness by the use of the feminine termination \$\hat{\mathbf{c}}.

Hindi has also a few words in III, with joining vowels e and o, as मरेजा "a young peacock," from मीर "a peacock;" सपोका "young make," from giv "snake;" or without the joining vowel, as within "a bamboo flate or pipe," from with "bamboo" (Skr. क्षेप्र), also written बांसरी and बांसरी. There is also a form which is interesting as exhibiting the retention of the Sanskrit affix a in a diminutive sense; तनदा "a small pond," from ताल "a lake;" महेचा "a small hut," from मण्डप "a shed." The first of these words is derived from Skr. तहान, Pr. तजाकी. through a fem. Herfiles, of which the Pr. form would be मचाइया: the last is from अंदिविका. The masculine form of this suffix is seen in दोलत "a small drum," from दोल "a drum," and perhaps in the rare form बा, G, बो; aka in Pr. becomes ao, and the wis inserted to soften the hiatus, as in H. बक्रवा, from बक्रा "calf" (Skr. कल्छ) ; G. कोडवी "small sprout," from wis "spront;" greal "small bush," from gre "bush." In some feminines from originals with barytone or mute a terminations, the diminutive is TAT, as

> श्रीवद्या "small mango," from श्रंव, आम "mango." श्रीवद्या "boddice," "श्रंव "body."

In B. and O. the forms of the diminutive T are generally the same as in Hindi, and, as in that language, have to a great extent lost their special meaning. In O. especially, and to a great extent in the others, the addition of T may be made to almost any noun at the will of the speaker, and would in most places be perfectly understood as indicating contempt.

There is to be found more or less frequently throughout the group another diminutive form in Z, generally with joining vowel e or o. If we consider this Z as allied to the Wof the abovenamed form, we should have to put it first as an older form, which has been subsequently softened into Z; but there are difficulties in the way of this process. The junction vowel of the forms Z and W is either o or c, which two vowels represent, in my opinion, the nome mass, and oblique endings respectively of the noun, whereas the junction vowel of the Z form is generally a, only occasionally in M, we find o. From this it would result that T is used with words whose ending is a mute, or a consonant Z and W with oxytones in o or a, oblique c; and inasmuch as these vowels in a large number of cases indicate the presence of the suffix &a in Prakrit, words formed with them would be early Tadbhavas, as H. HOW and the like, while the words in W would be to a great extent late Tadbhavas. Instances of the Z type are—

8. बाहोटी "small fire," from बाहि "fire" (Skr. बह्रि). 8. बामोटु "village headman," , बामु "a chief."

Trumpp, from whom I take these instances, points out that the diminutive in Pashtu is regularly formed by utai. Bellow (Pakhto Gr. p. 108) restricts it to nouns ending in  $\omega$ , and gives as instances:

अवद्यां, "man," سروقي sarofai, "a small man" (which may be written सडीटर्).

الكوني "argajai, "stick," الكوني "largajai, "small stick," नरगोटर्jina-î, "girl," جنوني "jinajaï, "little girl," विनोटर्

The existence of this form in Pashtu is a confirmation of its antiquity, and justifies my attributing it—as I did above from independent reasons—to the early Tadbhava period. It is not so common in the other languages, though instances are not entirely wanting.

In M. चिंधूर and चिंधीरी "a wretched rag," from चिंधी "a rag;"
hut more frequently without the junction vowel merely, as Z, खांबर "a
amall post," from खांब "post;" उच "high," उच्र "highish;" खार
"sait," खार्ट "saitish," "brackish;" जळका "scorched," जळकर

"slightly scorehod;" च्य "pressing," चेपट "flattish;" चिंव "wet," चेवट "moist;"

H. चमोटी "a small strip of leather," P. G. id., M. चामोटा, व्टी. from चाम "leather;" हिर्गोटा "a fawn," from हिर्ग "a deer;" G. चर्चु "a writing," अखोटी "a note," "a small letter."

§ 25. In the formation of compound words the modern languages, while lacking the exuberance of the Sanskrit, are not altogether wanting in strength. It will be useless to discuss those words which have been formed in Sanskrit, and borrowed whole from that language in modern times. The modern grammarians needlessly bewilder their pupils by leading them through all the mazes of Tatpurusha, Bahuvrihi, and all the other methods of making compound words, which are in use in Sanskrit. In the present section it is proposed merely to note the instances that have been found of compounds made in modern times principally from Tadbhava or Desaja materials, and to endeavour to ascertain the law that underlies their structure.

That simplest of all methods of forming compound words, which the Sanskrit grammarians call Tatpurusha, is still in force in our seven languages, as it is in most modern languages of the Indo-Germanic family, being a special characteristic of that family, and surviving through all the changes brought about by time. The seven languages therefore have formed compounds of this sort from their own stores, from Tadbhava and Desaja words. Under this class are included those compounds formed from two nouns one of which governs the other; familiar instances in our own language, which is rich in these words, are shipowner, horseman, housekeeper, and the like. In these words we have an inversion, the governed or dependent word being placed first, whereas in the separate construction they would stand last, as owner of a ship, man on (or with) a horse, keeper of a house. Further, it is not only in the genitive

relation that the dependent word stands; according to the grammatical rules of each language, it might stand in many of the other cases or relations. In some of the languages, consequently, the dependent word, when put first, takes the oblique form, which is common to all cases of the singular, and by itself denotes simply the state of dependence, the particular kind of dependence being indicated by case-particles, which are omitted in the compound. Thus:

- 8. घर्धणी "housemaster," from घर जी धणी "muster of the house;"
- S. उत्तर्वाड "north wind," " उत्तर जो वाड "wind of the north;"
- —where घर जो. उतर जो, are the genitives respectively of ध्रम "house," and उत्तर "the north," which ending in the nom, in u, form their oblique in a. Similarly, in
  - S. मधेखांक "hend-enter," from मचे जो खांक "enter of the head" (जिल्ल. termenter):
  - 8. कर्निटुट्रो "hand-broken," " कर्नि को दुट्रो "broken of hands" (fig. lazy);

we have in the first the oblique singular in e of the noun state. These languages which use the Persian character obscure the real nature of such compounds as these by writing the two words separate, or rather—inasmuch as some Persian letters cannot be joined to the following letters, and native scribes seldom leave any space between their words—it is impossible to say whether the word is written as one or two. Thus in the Persian character may be meant for one word or two, for all that we can tell from the writing. It is only in the case of those letters which have a separate final form that we can tell: thus we word the final long in the regarded as two words on account of the final long in the writing; it is one word. This is, however, merely a detail of writing; in speech, these words would be regarded as one.

In Hindi the rule of placing the dependent word in the oblique form is disregarded: only one class of nouns, that in d, has an oblique form, and this is not cared for; thus we have from when where," oblique will, the following compounds:

```
पुरचंदा "horseman," from घोडे का चढा "rider on a horse,"
घुरदीय "horse-race," " घोडे का दीय "running of a horse."
घुरसान "horse-stable," " घोडी का साल (भाना) "house for horses."
```

In all these cases no sign of the oblique form remains; but the Hindi, being sensitive about quantity, shortens the vowel of the first member: thus d becomes a, t becomes t, a becomes u, and the diphthongal vowels o and e turn respectively into u and t.

Words ending with the long vowels û, i, û, also generally shorten those vowels, in which case the so shortened vowels drop out altogether: thus, as we have seen, भोड़ा becomes in composition भुद्र: so also पानी becomes पन, and जोड़ा becomes जुद्र.

The following examples will illustrate the above remarks:

```
प्रभावा ("a shed for sell-
ing water," team पानी "water," and शाला "hall."
प्रभाव "a quay," "पानी "water," and घाट "a ghalf or
passage."
प्रभाव "a botel-garden," "पान "hetel," and घाटी "garden,"
also written पंदाबी.
पुलसाडी "a kind of brework," "पूल "flower," and सही "easende."
बतबहाद "a profix talker," "बात "word," and सहाद "pro-
longation."
बटमार "a highwayman," "बाट "road," and सार "striking,"
जुहसूर "iron filings," "जोहा "iron," and बांदा "pot."
```

There is also a class of compounds of the Tatpurusha kind in

which the first letter of the second or governing member is elided, as-

H. मुलेल "an oil scented with flowers," from पूर्व " flower, "and तेम "oil." H. सडांघ"a smell of rotting substances," ,, सडा "rotten," and शंघ " smell,"

This class is very numerous in Marathi and in Panjabi, less so in the other languages. Instances in Panjabi are—

कपडिसांध" smell of burnt cloth, "from कप्पड़ा "cloth, "and गंध" smell." करियांध "smell of a camel," " कर्ड़ा "camel," " id. कियांध "smell of raw meat," " क्या "raw," " id. खटियांध "sour smell," " खड़ा "sour," " id.

—in all of which the final long d of the first element in the compound is shortened to i.

One familiar set of words, however, runs through all the seven, namely that formed by MIC "maker," These have been partially given in Vol. I., but may be again detailed here—

Skr. मुवर्णवार "goldsmith," Pr. सोखारो, H. सोनार, P. मुनिवार, S. सोनारो, M. सोनार, B. सोखार, O. मुखारी.

Skr. कुश्वकार "potter," Pr. कुम्हजारो, H. कुम्हार, P. id., M. G. कुंभार, S. कुंभार, B. कुंभार, cuigo कुमोर, O. कुंगार, कुंगार.

Skr. चर्मकार् "leather-worker," Pr. कम्मजारी, H. चमार्, P. G. id., M. चान्हार्, S. चमार्, B. चामार्, O. चमार्

The Chingana retains the older form in  $\overline{\operatorname{art}}$ , but in the plural with softening of k to g, as—

machengure, "fishmonger," from mache, "fish."
massikore, "butcher," , mas, "flesh,"

The former word is constructed with the plural because it implies "one who sells many fish;" macheskoro would mean "a man who only sold one fish."

Paspeti, Tching, p. 53.

Similar is the treatment of wit "holder," in

• Skr. सूत्रधार् "corpenter," Pr. सुत्तहारी (?), H. सुतार, G. id., B. O. कुतार् (सुतार), M. सुतार, with dim. सुतारडा, S. सूटहडु:

Skr. स्कंघधार "palanqueen-bearer," Pr. कंघहारों (रे) or कंहहारों, H. बहार, M. M.;

—where the aspirated letter has been changed to ₹ and ultimately elided. Further illustrations are—

H. खंतिल "scented oil," from खल "sediment of un oil mill," and तेल "oil,"

H. राउत "name of a caste," " राजा "king," and दूत " messenger," or राजा "king," and पुत for पुत्र "son."

M. धूपेज "a resinous oil," " धूप "smoke," and तेज "oil."

M. आंबटाण ("a smell of sour," and घाण "smell."

M. क्षेटास ("a smell of singed food,") .. क्षेट "burning," and घास "smell."

Marathi has numerous compounds indicating various kinds of prepared, scented, or medicinal waters, the last element of which is पान्ती "water," changed into द्वारी: thus—

चंत्रवर्षी "mango-water," from चंत्रा "mango," पागी "water." दक्तवर्षी "water beated in the sun," " सुळ "sunlight," id.

Of compounds which would be classed as Karmadhāraya by Sanskrit grammarians, many have been preserved from Sanskrit, but the modern languages have created some out of their own stock. Trumpp gives the following from Sindhi:

वडाखाक "a gintton," वडा "great," खाक "eater." घणपुरी "well-wisher," घणी "much," पुर (s.f.) "wish."

But others which he adduces, as महाज्ञणु "a merchant," from महा + जन = "a great man," and परसोजु "the other world," are Sanskrit, and are in use in all the languages.

The following instances of modern Karmadhārayas are from Hindi:

```
वडपेटा "hig-bellied," from वडा "hig," and पेट "belly."
असमानुस "polite," " भना "good," " सामुस "mam."
समर्तमा "long-legged," " लावा "long," " तेसा "leg."
अधकपानी "hemiplegia," " आधा "half," " कपान "akall."
अधकपा "half-ripe," " आधा "half," " कपा "raw."
समन्द्रा "ahare"(lit.long-cared) " लावा "long," " लावा "ear."
```

The adjective in Hindi typically ending in d, an adjectival termination has been added to the nouns which form the last member of these compounds, in all cases in which the compound itself is used adjectivally; and the first member of the compound, if it contains a long vowel, has that vowel suphonically shortened.

Marathi is very rich in compounds, almost more so than any other language of the group. A few instances of Karmadharayas are here given:

```
बाळमांजर "a pole-cat," from बाळा "black," मांजर "eat."
तांजडमाती "red earth," ,, तांजडा "red," साती "earth."
सांजतांग्या "long-legged," ,, सांज "long," तांग "leg."
काळतांडाा "lockless," ,, बाळा "black," तींड "face."
वरीमत "prospecity," ,, बरा "good," मत"condition"(मति).
```

In Gujarati, as far as I can judge from the works available for consultation, the practice of making compounds out of modern elements is not carried to so great an extent as in some of the other languages. Instances are:

```
भणमनसाइ "politeness," from भणा "good," सानुस "man."
मोदुमाणस "a grandee," " मोदो "great," माजस "man."
```

Dvigu compounds, namely those in which the first element is a numeral, are exceedingly common in Hindi, and almost equally so in the other languages; thus with दो "two," as the initial element, sometimes shortened to द:

H. दोभाषिया "an interpreter," from भाषा "speech."

H. दोपट्टा "a cloth of two breadths," " पट्टा "strip of cloth."

U. दोणडा "a necklace of two threads," ,. जद "thread."

H. दोबीया "pregnant" (with two lives), .. जी "life."

H. दुसरी "a weight of two sers," " सर "a weight of 2 lbs.

II. दुश्रत्री "a two-anna piece," " आगा "an anna."

With तीन "three," shortened to ति:

H. famel "a necklace of three threads."

H. तिपीं जिया "a building with three doors," from पील "a door."

With चार "four," which becomes in composition ची, i.e. चड from चतुर, with dropping of त, according to rule, and elision of final र:

H. ची खन्नी "a four-anna piece."

H. चीकर "a framework for a door," from कार "wood"

H. चीकडी "earring," " वडी "ring."

H. TUCT "a box with four partitions," " UC "bouse."

H. THE "the four months of the rainy season," .. HIE "month."

All the compound numerals are Dvigus, as will be noticed presently. It is not necessary to give illustrations from the other languages, as they are formed in precisely the same way as in Hindi.

Dwandwa compounds, strictly speaking, do not exist. The Dwandwas of Sanskrit consisted of two nouns or more compounded together into one word, the latter of which took the terminations of the dual noun of the a-stem, or that of the plural, according to the number of things expressed in the the inflexional terminations of the old synthetical languages, it is clear that no Dwandwas in the Sanskrit sense can exist. There are abundant alliterations where two or more words are put close together, and only the last word takes the case-affixes: thus one may say, and only the last word takes the case-affixes: thus one may say, and only the last word takes the case-affixes: thus one may say, and only the last word takes the case-affixes: but these are hardly compounds. The same remark applies to the very numerous cases where a second word is added to the first so as to jingle with it, such second word being for the most part quite meaningless; as in S. sa wa wa "talk," where we has no meaning; such are, where we has no meaning; such are, we used down," and many others.

Bahuvrihis are easily formed in all the languages by giving an adjectival termination to any of the foregoing classes of compounds, and in fact several of the examples given above are Bahuvrihis. Further illustrations are unnecessary.

§ 26. Numerals.—The cardinal numbers up to ten inclusive are simple adjectives, some of which are declinable, others not; from eleven up to ninety-nine they are, as was stated in the last section, compounds to a certain extent of the Dvigu character. Each numeral, though a strong family likeness runs through them all, stands on its own basis, and is derived directly from Prakrit, through the operation of the phonetic laws of its own language, and it will therefore be necessary to examine each one separately and in detail.

ONE.—Skr. 更表, Pr. 更素, H. 更素, P. 文章, S. 信責, 夏季, 更素, 更素, 更素, 更素, 医有囊引, 医有囊引 (Sindhi is never contented with one form); G. 更素, usually written 董章; M. 更素, 夏季, O. B. 更素; Gipsy yel. It is indeclinable in H. and P., but may take case-affixes when standing alone; the two Sindhi forms in 蒙 are diminutives, and that language has put on an 蒙 in front, the reason for which is not apparent. B. pronounces it very short and harsh,

something like yeak, rhyming with the English words pack, whack. The Wis long in all the other languages except P. and S., and the double W of Prakrit has therefore been reduced to a single. Old-II. has constantly W and W.

Two.—Skr. base g and g , Pr. दो, H. दो. P. दो, M. दोन, O. B. दूर, Gipsy dai; but S. म. G. दे. Here S. and G. stand apart from the others, they having, as pointed out in Vol. I. p. 331, assimilated the द to the q, and thus made ज , out of which S. gets its peculiar sound ज; S. appears to have taken the base g, and G, the base g. H. and P. have probably also taken the base g, and resolved the semivowel into its vowel, thus getting दूज, whence दो; the forms दोच. दोई, दूज, and दूर are, however, found in the earlier poets. M. दोज contains the type of the neuter plural; this is unknown in Skr., and has probably been extended to this numeral from M. तीज

THERE. Skr. base [4, nom. pl. neut. 4]fff, whence Pr. तिथि, and Gipsy trin, H. तीन. P. तिन, G. तथ, M. तीन, O. तिनि, B. तिन. All these are neuter plurals by origin, and from this, as observed above, M. has apparently imitated its होत "two." P. has also a commonly used form दे, which agrees with S. 2, as far as the subjoined T and vowel are concerned; but S. has changed a into Z, under the influence of the following र: both these forms lead back to the Skr. masc. चय: If it be asked why two languages out of the group should adopt the masculine, while the others take the neuter, it might be answered, that S. and P. (especially S.) are often more archaic in their forms than the other languages, and that H. has probably not deliberately adopted the neuter plural; but as three is the first numeral that has a distinctly plural meaning -one and two being respectively singular and dual in the purent speech-H. has indicated the idea of plurality by adding the sign which indicates plarality in the noun, where, as it will be seen hereafter, the termination of the neuter plural has usurped the place of all other plural forms. Kashmiri, a very archaic dialect, uses चिन्न, and we may therefore place it, together with the Gipsy, P. and S., on a higher level of antiquity than the others; Gipsy by its additional न (unless this is to be considered merely as anunāsika) standing halfway between the three western languages and H., and its followers O. B. and G. It is characteristic of G. to be careless about short vowels; तम for निम्न is a parallel to तम "ye," for नम.

Form—Skr. base \(\frac{1}{2}\)\text{\text{q}}\, nant. pl. \(\frac{1}{2}\)\text{enif}\(\text{\text{t}}\), whence \(\text{Pr. }\)\text{q-rif}\(\text{\text{t}}\).

B. and O. \(\frac{1}{2}\)\text{ff}\(\text{\text{t}}\), H. P. G. M. \(\frac{1}{2}\)\text{T}\(\text{\text{Gipsy star, shtar, inhtar, probably by inversion from tsar, \(\frac{1}{2}\) having in M., and possibly formerly in S. also, sometimes the sound of ts, also in Kashmiri tsar = \(\frac{1}{2}\)\text{T}\(\text{\text{t}}\), a sound due to non-Aryan influences.

The entire loss of the nexus स. which had become त in Prakrit, is unusual, but possible in the case of so-much-used a word as this, and it need not surprise us when we think of तरखाने = तहां, colloquially तां.

Five.—Skr. base पंचन, but the final a drops in the noninative, and in fact throughout the declension. Pr. पश्च, H. पांच, and so in M. G. B. and O., but S. and P. have पंज, with the tenuis softened to its media. Gipsy and Kashmiri have pantsh, which is written in the latter पांच, and M., though it writes पांच, pronounces pants.

Six.—Skr. base uu, but nom. uz, which is also the declensional base. Pr. 要, whence H. 要, and dialectically 变, P. 变, S. 要 and 证明, G. 要, O. 要u (pronounced chich), B. 更过; but M. 证明, where the 理 is regular Marathi for 要, see Vol. I. p. 218, and the g akin to S. 要要. How u came into 要 it does not concern us to inquire, as the process took place in earlier times than we are dealing with; Kashmiri has still u, as fug. with which may be compared Gipsy (Ut. Wit) sho, shoe.

Savan.—Skr. सञ्ज, the ¬ being dropped as in पञ्च, Pr. सπ. whence H. सात (see Vol. I. p. 287), where this numeral is treated of as illustrating the strong nexus). The Gipsies use εfia, which shows traces of Greek influence, ἐπτὰ becoming ἐφτὰ; as Paspati (p. 77) points out, there is a frequently occurring change of π to φ in the transition of words from Greek to Chingana.

Emmr.—Skr. wei or wg, Prakrit wg, H. wiz, P. wg, S. wz, M. G. O. wiz, B. wiz. All these are regular phonetic changes. Kashmiri has also wiz, but Gipsy again approaches the Greek with ochlo, which Paspati says is modern Greek ὀχτώ for ὀκτώ,

NERE.—Skr. नव, Pr. खुख, H. नी, which is also written नव, P. नी or नच, S. नव, G. M. नव, O. नच (noh), B. नव, Kashmiri नी and नी, Gipsy again Greek enea=ebwed. Had the Gipsies only learnt to count as far as six when they left India? With the exception of ten and twenty, they have few distinctly Indian numbers above six.

Ten.—Skr. 文明, Prakrit 文明, whence H. 文明, B. and O. 文明 in literature, thanks to the Pandits; but people when they talk or write to one another use 文明; G. 文明, P. 文明 and 文章, M. 文章, which is strange, as M. does not usually change 明 to 夏. S., as might be expected, has 夏夏, Kashmiri 夏夏, Gipsy desh. This numeral presents no special features.

There is a regular ascending scale in the numerals. The cardinals up to ten are simple derivatives from Sanskrit; from ten to nineteen they are compound derivatives from the same, but inherit the system of composition handed down from the carlier language. From nineteen onwards they form their numerals in a way of their own, which agrees at the same time in principle with that of Sanskrit, but differs from it so far that the materials of which the compounds are composed are of modern origin in many respects.

It will be more convenient to exhibit each group in a tabular form. Here follows the group of "tens":—

뫮	8	13	7	11	10	41	118	g
वाद्य	事	बयोद्य	चतुद्ध	पंचदश	पोडग	няел	WEIGH	क्रमवियाति
वारह	नित्व	ho	4354	पण रह	Blank	समस	報を下書	क्रमदीसद
भारत	Reg		मीदह	4天世	前用商	समारह	Watte	चनीस
H.	E	142	बादा	पंदर्भ	मुक्त	समादा	क्रार्	उमीह
मारह	E	-	वाडा	पेट्रह	after	H	12.1	वर्गीह
111	de.		म उद्	Tex.	स्रोक	सतर	अदार	बीगणीस
बारा	वित		बीदा	पंचरा	सीका	सथा	वडरा	पक्षणीस
नार	E		माद	dur	साहक	सतर	Wat	BATET
नारी	E		क्रीव	प्रोहेर	मीम	सतिर	WIGH	of Fig.

These all follow Vararuchi's well-known rule ii. 14, by which the ₹ of ₹₦ is changed to ₹, and ii. 44, by which ₦

is changed to g. This type Tg is throughout retained by H., which even in "sixteen" has dialectically ETTE as well as the more classical atwee; the final g, however, not being a favourite or common ending in any of the languages, is mostly dropped, and its place supplied by long a, produced by combination of the two short vowels; thus बारड becomes बार क by elision of g, and then M. TITT. The final long o, which is exhibited above in B., is quite inorganic, and arises from the habit Bengalis have of pronouncing was o; this short o is lengthened in counting, and we thus find art, but it would be quite as correct, or rather more so, to write TIT, pronouncing bare. P. and S. add anunasika throughout, and S. retains the V. but it can hardly be said that the nasalization of the final syllable has any organic foundation : it is, I believe, merely another instance of the nasal way these people speak. One often hears a distinctly nasal twang given by natives to words where no nasal is written; and until some better and more rational standard of spelling shall be introduced, it is merely lighting with the air to reason about the origin of these anunasikas, many of which are nothing more than local accent, and have no foundation in etymology.

As to "eleven," it is noticeable that the \$\overline{\pi}\$, which was dropped in scenic Prakrit, still holds its place, though sometimes softened to \$\overline{\pi}\$, or even \$\overline{\pi}\$, in the moderns; the \$\overline{\pi}\$ or \$\overline{\pi}\$ which appears in H. \$\overline{\pi}\$\overline{\pi}\$, P. and G., is probably by inversion from \$\overline{\pi}\$\overline{\pi}\$, and the prosthetic \$\overline{\pi}\$ of G. is inorganic. In "twelve" is seen the rejection of the initial \$\overline{\pi}\$ already noticed. "Thirteen" seems to have been wrongly worked out by Cowell; following Vararuchi (p. 121, note), he would make trayodaša first into treyodaša, which is not, I think, what Vararuchi means, as in i. 5 he couples teraha with sunderum = sanutaryam, and similar words. He probably supposes a transposed form taryodaša, which by his rule becomes terodaša, by the palatal vowel leaping over into the preceding syllable (Vol. I. p. 135): the steps are trayo, taryo, tario, tairo, tero. Then the syn-

chronous change of dasa to raha produces teroraha, easily contracted to teraha in Pr., because o is habitually short, and teroraha, ter'raha, is a natural contraction.

In the case of "fourteen," Prakrit does not change \$\tilde{\chi}\$ to \$\tilde{\chi}\$, probably because the \$\tilde{\chi}\$ of \$\frac{1}{43}\$ had been assimilated to the following \$\tilde{\chi}\$, making \$\tilde{\chi}\$; this is followed by all the languages except \$S\$, which sticks to its favourite \$\tilde{\chi}\$.

More irregular than the foregoing is "fifteen." Here the anuswara operates, and by Var. iii. 44, the nexus ₹ is changed to ₹ (it would in Pali have been ₹). This double a has become anuswara, and ₹ inserted, or in some cases ₹, owing to the influence perhaps of the following ₹. Bengali has preserved the Prakrit type, merely lengthening the vowels by its broad rustic pronunciation. Here also the ₹ is an eccentricity for ê=▼, and one might accurately write ₹₹.

Skr. has in "sixteen" changed the \(\xi\) of \(\xi\) no \(\xi\), under the influence of the final \(\xi\) of \(\xi\), and this cerebral sound is expressed in the moderns by \(\xi\) in those languages which possess that sound, and by \(\xi\) or \(\xi\) in those which do not. I am not aware of any authority for a Pr. form \(\xi\) larg, and give it as more conjecture, following Trumpp; though perhaps \(\xi\) its would be more correct for \(\xi\)) = \(\xi\) q and \(\xi\) = \(\xi\).

Of the remaining two there is only this to remark, that P. lengthens the second syllable of "seventeen" in imitation of "eighteen," while M. reverses the process, shortening "eighteen" in imitation of "seventeen."

The form for "nineteen" means "twenty less one," and was probably originally एकोनविंशति, from which we get the G. खोनखीस, by inversion for खगोणीस, and Old-H. खन्नीस and मुनीस; M. preserves an accurate form in एक्पीस. The same system prevails in "twenty-nine," "thirty-nine," and the rest. Prakrit has एक्प and एक्प (Weber, Bhag, p. 426).

The series "twenty-two," "thirty-two," "forty-two," etc., has been exhibited at Vol. I, p. 331, and the series "twenty-seven,"

"thirty-seven," and the rest, at p. 289, where also is shown the series "seventy-one," "seventy-two," etc., so that it is unnecessary to give these in detail again; the forms of "seventy" are included in the following table for completeness' sake, and because there are some inaccuracies in the forms given in Vol. I. p. 288:

		सब,	-	164			¥

Weber, Bhagavutt, p. 426.

Oriya does not use any derivative of faufa, but instead affau, i.e. "score." H. also uses and for the same. The languages are quite regular in "twenty" and "thirty," in the latter occasionally retaining the nexus tr, but more usually dropping the r. In "forty" the Prakrit of the Bhagavati has changed ₹ to ₩, and the nexus tt is dropped throughout. More irregular is "fifty," in which, as in "fifteen," Vararuchi's Prakrit substitutes ₩ for ☒; in this it is followed only by Marathi; the other languages refer back to the Sanskrit form, softening the ☒ into ☒ in S. and P. only. "Sixty" is also quite regular, as are also "eighty" and "ninety," except that M. and G. make the initial into c and m respectively, under the influence of the t in the next syllable.

It is when these numerals come to be compounded that they exhibit such wide variations of form, as to render it necessary for the student to learn each number up to "one handred" separately, and even when the phonetic and structural mechanism is explained, there remains a large residuum of eccentricities and peculiarities. Following the example of Skr., the modern languages do not merely, as do most other families of speech, add one number to another to express the numbers intermediate to each decade, but compound the two elements: thus H. does not say do aur bis, for "two-and-twenty," but makes a single word bâis; so do all the other languages. I shall first show the changes which the units undergo, and then those of the tens, as in every case the lesser numeral precedes, and they say "twotwenty," "threetwenty," and the like.

"Two." In by far the greater number of instances the form is बा, as in बार्ड quoted above, and in the examples given in I. 331. In "thirty-two," however, the long d is shortened to a before च, making बचीस. In "forty-two," the च of the चाजीस is clided in Pr., when it becomes the second member of a compound, so that we get बायाजीस in Bhag, the च being inserted to fill the hiatus. This च in the moderns either

softens to ए. as in H. देखाओस "forty-two," or is added to the letter preceding, as O. आशीस. P. here has बता. in imitation of "thirty-two;" G. is irregular in बोहोतेर "seventy-two," and B. and O. insert an inorganic र in दिरासी "eighty-two," विराज्ये "ninety-two." With the exception of these few irregularities, the general type आ? is regularly kept throughout.

"Three." The regular type is ₹, shortened in some places to ₹π, and occasionally with an euphonic ₹ added, making

fac: thus→

H. तेर्स "twenty-three," तेतीस or तेतीस "thirty-three," तेथाजीस. also तेत° and तेत° "forty-three," तिर्पन "tity-three," तिर्मड. ते॰ "sixty-three," तिहत्तर "seventy-three," तिर्मि "eighty-three," तिर्मिव "ninety-three."

- P. तेर्द्र "twenty-three," तेती "thirty-three," तेताली, तिर्॰ and तंत॰ "forty-three," तियंत्रा, तिर्॰ "fifty-three," तेहुउ "sixty-three," तिहृत्तर "seventy-three," तिरासी "eighty-three," तिरासी "nlasty-three,"
- 8. देवीह "twenty-three," देदीह "thirty-three," देतालीह "fortythree," देवंजाह "fifty-three," देहिंद "sixty-three," देहतरि "seventythree," दिजासी "eighty-three," दिजानवे "ninety-three."
- G. तेवीस "twenty-three," तेतरीस "thirty-three," तेताचीस. तेहे॰ वं॰ "furty-three," तेहेपन "tifty-three," तेहिसठ "sixty-three," तोहोतेर "seventy-three," तेत्रासी. तासी "cighty-three," तांगू "ninety-three."
- M. तेवीस "twenty-three," तेतीस "thirty-three," वेवाळीस "fortythree," वेपस "lifty-three," वेसष्ट "sixty-three," वेष्ट्रतर् "seventy-three," व्यावामी "eighty-three," त्यासव "ninety-three,"
- 0. तेर्द्र्य "twenty-three," तेबीय "thirty-three," तेबाकीय "forty-three," तेपन "lifty-three," तेबढि "sixty-three," तेसुरि "seventy-three," तेबाशी "eighty-three," तियानवे "ninety-three."
- B. तेर्ण "twenty-three," तेचीण "thirty-three," तेताणीण "fortythree," तिष्पास "tifty-three," तेषड्डि "sixty-three," तेहात्तर "seentythree," तिराणी "eighty-three," तिरानश्चर "ninety-three."

"Four," takes the compound from st throughout, with variant spellings ची, चव, and चव; the numbers may be made up after the example of the threes, an euphonic \(\mathcal{\text{theing}}\) being inserted before a vowel, like fat. "Five" is in composition ut, un, u. and P. and S. एंज, M. has प्र in प्रसीस "thirty-five," and G. पिस in पिसाळीस "forty-fiva." "Six" is always क्. क्य, or क्. except in M., which is unlike the rest, changing & into I and स in its usual fashion : thus while "thirty-six" is इतीस, and "fifty-six" क्ष्पन, it uses सञ्जीस "twenty-six," श्रेचाचीस "fortysix," सासष्ट "sixty-six," शाहत्तर, शहत्तर "seventy-six," शांखशी "eighty-six," and 知明可"ninety-six," "Seven" and "eight" exhibit no irregularities, and "nine" is not used as a prefix, the periphrasis with 334 "less than" the next higher number being used in its stead. H. however has नवासी "eighty-nine," and निमानवे "ninety-nine," in which last it agrees with P. नदीनवे and the other dialects. S. has two singular forms, नधानवे and वधानवे, apparently from नव + अधि + नवे "nine upon ninety," or some such expression; in one case the q, in the other the st of stat has suffered elision. Chand uses this method of compounding by means of will in the lines-

## सी संवत नव सत श्रद्ध ॥ वरस तीस कह अग्रग॥

"That (was) the year nine hundred (and) over Years thirty and six before."—i. 221.

meaning to indicate Samvat 936, A.D. 879. The reduplication of the W is metri gratia.

With regard to the latter part of the compound, बीस becomes ईस in H., ईश in O. and B., ई in P., but बीस in G. and M., बोह in S.

तीम remains unchanged. चालीस loses its initial, and sometimes takes त. as in H. तेतालीस.

"Fifty" undergoes very wide changes. In H. it changes from पदास into दन in एडा + वन "fifty-one," दावन "fifty-two," बावन "fifty-four," सतावन "fifty-seven," खटावन "fifty-eight;"
and into पन in तिर्पन "fifty-three," इप्पन "fifty-six," प्रथम
"fifty-three;" both these are probably the first half of an older form प्राम, the annowara of which has been hardened to
म, the initial u is softened to च after vowels, unless it be thought preferable to see in these forms a relie of the Pr.
uuitai. In P. पंजाब changes to चंजा, except in परिचा "fifty-four" and दिएंजा "fifty-six." The same occurs in Sindhi, whose पंजाब is regularly changed to चंजाब, as एक्टबंजाब "fifty-one." G. follows H., as do also O. and B., with very trifling changes; for "fifty-five," however, they use G. पंजाबन, O. पंजाबन, B. पंजाब, in opposition to H. पंजाब.

With "sixty" S. and P. have recourse to their characteristic change of ₹ to ₹ throughout; thus

P. इकाइट. S. एकहर्डि "sixty-one."
,, बाहट. ,, बाहिट "sixty-two," etc. etc.

This course is followed by all the languages except O, in the analogous case of unt, but only by P, and S, in the case of "sixty." (For the series "seventy-one," "seventy-two," etc., see Vol. I. p. 288.) O, combines the u of unt with the following u, one of which it rejects, and inserts a labial vowel, thus producing ut, as unuft, and the

"Righty" presents no noteworthy features; but in M. भवट्र
"ninety" rejects the final ट्र, which is perhaps a relic of the
त of नवति in composition, and doubles the ज, at the same time
reatoring the cerebral type of Prakrit, which was inadmissible
in the single word, because the ज was there initial; thus it gets
जव. as in एक्बाल्च "ninety-one." G. follows an analogous
process, changing नेउं or जेने into ज preceded by anunasika, as in
चोरांज "ninety-four," पर्चाल् "ninety-five," जांज "ninety-six."
The other languages are regular.

In the junction of the two elements of these compounds it is to be observed that a long d is often inserted, but I am unable to lay down any rule for its insertion or omission, unless it be that where the initial letter of the second member is weak, d is inserted; where it is strong, omitted. Compare H. बाइस "twenty-two" for च + बीस with बचीस "thirty-three" for च + तीस; but even this rule hardly carries us through all the series. The Prakrit had originated these compound forms long before the modern languages came into existence, and the secret of the composition must therefore be looked for in that stage of speech; and the data for Prakrit numerals are unfortunately so defective, that us yet I have been unable to formulate any rules on the subject. Marathi introduces a joining vowel s in the series with "forty," and चा in the "seventy," "eighty," and "ninety" series; but the reason of this is not easy to find.

Above "one hundred" composition ceases, and the words are written separately, except in M. G. and S., which, from "one-hundred-and-nine" can combine the lesser numeral with the Skr. उत्तर "above," thus:

## "One-hundred-und-one," M. एकोत्तर श्रे, S. एकोतर सी. G. एकोत्तर सो.

§ 27. The ordinals of all the languages are formed each on its own basis for the first four numerals, but after that follow a regular system of genuine Sanskrit origin.

"First" has the following forms: H. पहिला, P. id., M. id., S. ugui, furgui, furgui, G. ugui. O. and B. generally use the Skr. ugu, but the H. urgui is gaining ground, and is heard among the lower orders constantly. If we derive these words from ugu, we are met by the difficulty of admitting the change of H into W or ζ, and I therefore suppose that they come from an unrecorded comparative ugu, which would stand in the same relation to the superlative ugu as Latin prior does to primus. Bopp (§ 293) has already established the fact that ugu is the superlative of H, and similarly (§ 321) he shows that all the cognate languages use the superlative form, as primus, πρώτος for πρότατος, and cristo=erst, from er=cher.

So also our own "first," in Old-English fyrst, is the superlative of "fore." There must also, one would imagine, have been a comparative, and this could be nothing else than NAC.

"Second" is H. दूसरा, P. दूजा, दूजा, इ. दिलों, जोजों, G. जीजों, M. दुसरा, O. दुला, but O. and B. often use दिलोंच. It is probable that the rude uncivilized Oriyas and Bengalia did not possess the idea of an ordinal till late times, when they naturally had recourse to Sanskrit to supply the want. Old-H. has also दूजा, which, together with the Panjabi form, are from Skr. दिलीच, Pr. दूजां, also दोच, but the medern दूजा refers to the form दुजा, formed by hardening the दूंच into जा, and then dropping one ज (Vol. I. p. 249). The S. and G. come from another Pr. form दिलाज, reduced by dropping the दू; this is further shortened into जीज. For the H. and M. दू and दुसरा, see under the next paragraph.

"Third." H. तीसरा, P. तीखा, तीखा, 8 ट्रिको, ट्रीको, G. तीका, M. तिसरा, O. and B. तिखा is in use, but तृतीय is common also. This ordinal is parallel to the last, and is derived from the Skr. तृतीय by the same process as the words for "second." The form तीसरा with its analogous इसरा seems to be a recent compound of the numeral themes दू, ती, with some word meaning progression, and probably connected with the root स "to go," but there are no certain facts on which to

found an opinion.

"Fourth" is regularly derived from the Skr. चतुर्थ, see

Vol. I. p. 144.

From "fifth" enwards the ordinals are regularly formed by adding H. 41, Old-H. 41, P. 41, S. 41, G. 41, M. 41, B. and O., having no ordinals of their own, use the Sanskrit terms when necessary. All these terminations come regularly from the Skr. 44, the termination of the ordinals. Hindi uses for "sixth" \$21, the regular Prakrit form of Skr. 42, and with this agrees G. \$21, but all the rest are regular.

<sup>\*</sup> See for further discussion of this question Chap. III. 1 84.

§ 28. Besides the cardinal and ordinal series, the languages have other sets of numerals formed in ways peculiar to themselves. Such are the fractional numbers, in which all the seven languages are rich.

"A quarter" is H. पाद or पाउ, P. id., S. पाउ, G. पाछ, M. पाद, O. पाए, पा, B. पोदा (पछा): the origin of all these is Skr. पादिक, P. पाइच "a quarter," the compound सपादिक = "with a quarter," becomes in Pr. सवाइच, and in H. सवा, P. सवा, सवाइ, सवाइचा, S. सवाई, G. सवा, M. सडा, O. सउधाइ, B. सउधा (sau'd). Thus H. सवा तीन "three and a quarter," and so in all the rest. On the other hand, the deduction of a quarter is expressed by derivatives of Skr. पादोन, i.e. पाद + कम "a quarter less." H. पोन, P. पड्या, पडा, S. पोचो, G. पोचा, M. पाक्षा (nearer to the Skr. than any), O. पोन, B. id. 'Thus पोन तीन "two and three quarters," or "a quarter less than three." In H. P. O. and B. we appear to have the locativa form, in the others a nominative.

Two other numbers also are peculiar to this group: "one and a half," H. इंड from Skr. हाई, concerning which see Vol. I. p. 238, and "two and a half," H. चढाई, P. डाई, S. चढाई, G. चढाई, M. चढाई, O. चढाई, B. चाडाइ, the origin of which seems to be Skr. चर्च + इंच, to which M. adds the conjunction च.

For "three and a half," "four and a half," and the rest, the languages add to the complete numeral the word H. P. साइ. S. साइ. G. साइ. M. साइ. O. साइ. B. साइ. from Skr. स + ऋषे = "with a half;" thus "three and a half" is H. साइ सोण. "four and a half" साइ चार, and so on.

The other species of numerals, such as "once," "twice," and the rest, will more appropriately be described under the head of Adverba.

## CHAPTER II.

## GENDER.

CONTENTS.—| 29. NATURAL AND GRAMMATICAL GENDER.—| 30. Use of Gender in the Saven Landuages.—| 31. Typical Terminations of the Adjective.—| 32. Terminations of the Magnetive Gender.—| 33. Terminations of the Feminise.—| 34. Terminations of the Neutre.—| 35. Formation of Feminise from Masculines.—| 36. Gender of Words excise in Consonants.—| 37. Decay of Gender.—Its Cause in Bendaliane Orita.

§ 29. Genner is of two kinds, natural and grammatical. Natural gender is that which refers to living beings, and is threefold: there being one form for males, a second for females, and a third for mankind or animals regarded merely as such without reference to sex. The human mind has, however, not rested content with this simple and natural use of gender, but has, by an effort of imagination, extended the distinctions of sex to inanimate objects, abstract ideas, and, in short, to all nouns of every kind. All languages are not alike in this respect: some retain all three genders, others only two, and some have had the good fortune to emancipate themselves entirely in the noun, and to a great extent in the pronoun, from these awkward and cumbersome swaddling-clothes of speech. This is happily the case with our own bountiful and practical language, and is an advantage for which we ought to be deeply thankful to our Norman ancestors, whose keen common sense led them to reject much that was useless and unwieldy in the speech of our English forefathers.

The older languages of the Indo-European family have all

10

three genders; those of the Semitic family got on very well from the beginning with only two, having never thought of developing the neuter. In the middle and modern Indo-Germanic languages the German still retains all three genders, while most of the others have only two, and some none at all.

Natural gender exists in all languages, grammatical gender only in a certain number. In those which do not observe grammatical gender, natural gender is frequently distinguished by having two separate words for the two sexes; in those which anknowledge both kinds of gender, the distinction is affected by a variation in the form of the word, most frequently in the terminating syllable or vowel. In consequence of this habit, it has come to pass that the form of the word has created the gender; thus, in deciding what gender should be ascribed to a word which indicates an object from its nature incapable of classification by sex, the form of the word is the only guide; and if it happen to be of a form similar to that which is appropriated to the male sex in living beings, it will be classed as masculine; if to the female sex, as feminine; and if to neither, as neuter. Both classes of gender exist in the languages we are considering, but in a very different degree. Gender is in all of them indicated to a great extent by variations of form, especially of termination; but it must be observed that whereas substantives have, as has been shown in the last chapter, a very great range of terminations, adjectives and the participial forms of verbs have very few. It is principally by observing which form of an adjective or participle is used with any given substantive, that we can tell what its gender is. For instance, H. sarak, "a road," is the name of a thing in itself incapable of natural gender; it is only by noting such phrases as bart sarak, "a big road," sarak bantt, "the road is being made," that we discover. it to be feminine. Hence it follows that in those languages which use very few participial forms, or whose adjectives have no distinctive forms for gender, we are unable to trace the

GENDER. 147

gender of substantives very clearly; such languages have only natural, not grammatical gender, and even the natural gender only in a limited number of instances finds expression in the form of the word used.

§ 30. Sanskrit has all three genders, so have the Prakrits. In the modern languages, only Gujarati and Marathi have all three. Sindhi, Panjabi, and Hindi have only masculine and feminine; Bengali and Oriya have no gender at all, except in the pure Sanskrit Tatsamas, now so largely introduced, which retain the form of the Sanskrit gender, but even this only in the higher style. In B. they say कोट बालव "a little boy," कोट बाणिका "a little girl," and कोट बज़ "a little thing." In the highflown literary style they would write सुन्द्र गर् "a handsome man," सुन्द्री स्त्री "a beautiful woman;" but in the common style, which is, after all, the true language, one would hear बुद्द मेथे for "a beautiful woman," without regard to gender. The same holds good in Oriya, and in both, even in the high atyle, there is no distinction between masculine and neuter. In this Chapter, therefore, we may dispense with these two languages altogether.

In Hindi, Panjabi, and Sindhi, the reduction of the three genders to two has been effected by turning both the masculines and neuters of Sanskrit into masculines; and as the common people in the two first-named countries are very careless about the use of the feminine, it may almost be said that grammatical gender scarcely exists out of books. The use of gender is still further reduced, even in literature, by the fact that a great number of the adjectives in those two languages end in consonants, and do not possess separate forms for masculine and feminine, so that they afford no cine to the gender of the substantive, which is only perceptible from the numerous participial forms of the verb.

In Sindhi some of the neuter nouns of Sanskrit have become

148 OENDER.

feminine, but the most part are masculine. As before mentioned, all nouns in Sindhi end in a vowel, and the distinction of gender is therefore more clearly recognizable than in the other languages wherein consonantal terminations abound. There are, however, some adjectives, mostly of Arabic or Persian origin (though some are pure Sindhi), which, although ending in a vowel, do not change either for gender, number, or case; as we plentiful, "Skr. were; as we mixed," Skr. we: which are Sanskrific; and "whole," "good," "distressed," which are Arabic and Persian.

Marathi still retains in full and every-day use the whole three genders, and the same is true of Gujarati. Not only have the substantives three genders, but the adjectives also, and the greater part of the tenses of the verb, being participial in form, have also three genders, so that to a foreigner the difference in this respect between these two stilted languages and the simple, may, but in no whit less expressive Bengali, is at every turn apparent.

In all the five languages which have gender expressed, the masculine is used to denote large, strong, heavy and coarse objects; the feminine small, weak, light and fine ones; and the neuter, where it exists, represents dull, inert, and often contemptible things. So far is this carried, that in cases where the original word was only masculine or neuter, a feminine form has been invented to express a smaller or finer article of the same kind; and, conversely, where only a feminine form existed, a masculine to express a larger or coarser object has been struck out. Instances are:

Skr. आवर्ड "pet" (a.), H. हांदा "a large cooking pot" (m.), हांदी "a small cauldron," or "earthen pot" (f.).

Skr. गुढ and गोल "ball" (m.), H. गोला "cannon-ball" (m.), गोली "bullet," "pill" (f.).

Shr. 天气和 "rope" (m.), H. 天概1 "cable" (m.), 天戦1 "string," "cord" (f.).

Here the final i of raçmi having been lengthened, and i being universally regarded as a feminine termination, a masculine in a has been created. This distinction runs through all the languages, and is even found in B. and O., which, although careless in the matter of gender, still recognize the difference between the termination in a, as denoting larger objects, and that in i, as denoting smaller. This will be more fally treated under the heads of the various terminations.

In M., with its three genders, the different shades of a common meaning, as indicated by gender, are illustrated by the following examples:

चिरटा (m.), "a large piece tora from a plantain leaf, used to अरका up goods in."

चिर्टी (f.), "a small piece of the above."

चिर्णा (m.), the same as चिर्टा.

चिर्शी (f.), the same as चिर्टी, also "a small chisel."

चिर्वे (a.), "a small chisel," "the act of tearing."

ATEI (m.), "a large cart, or waggon, for conveying loads."

बाडी (f.), " a small cart or carriage for conveying persons"

बार्ड (क.), "a clumsy or ricketty old car or dray."

दोर (m.), " a cable."

होती (f.), "a thread."

दोरा (m.), "a string," " thread," " streamlet," " track."

घोडा (m.), "a stone."

भोडी (f.), "a large mass of rock." (Here the fem. expresses the larger object, which is unusual.)

In the case of animals, the masculine and feminine indicate the respective sexes, and the neuter either the young or the whole species collectively; as

घोडा (m.), "horse." घोडी (f.), "mare." Bit (n.), "the horse," i.e. the genus Equas generally.

बक्त (m.), "n he-goat,"

बक्री (f.), "a she-goat."

वकर and वक्क (s.), "a kid," also the goat species in general.

The same practice exists in Gujarati; as

घोडो (m.), "horse."

घोडी (f.), "mare."

भोई (a.), "a wretched screw of a horse," also horses in general or collectively.

पाडी (m.), "a buffale-bull."

पाडी (f.), "a buffalo-cow,"

UT (u.), "a buffalo-calf."

These peculiarities of gender and its terminations will come out clearly as we work through this Chapter, and need not be further illustrated here.

§ 31. The adjective in all the languages exhibits the general type of the terminations for gender, and is so fixed and regular as to afford a standard for each language. The general type of the adjective is as follows:

	. 02	ROUL.	AH.	PLUBAL.			
	M.	F.	N.	M.	F.	N.	
Hindi	ā	11	1		to and tan	_	
Panjabi	4	I.	_		lân.	_	
Sindhi	0	1		iž	iyun.	_	
Gujarati	0	1	1999	â	1	du.	
Marathi	å	1	en		yd	In.	

It is not of course meant that these are the only terminations of the adjective or participle, but that among the numerous

A Narmadis' ankar's example is "When the Gaskwar same to Bombay, he brought a great number of homen (phenan phena) with him."

terminations that are found these are the chief, and, so to speak, radical ones; the others may be regarded as exceptions and deviations, to be explained in their place.

In the participial forms which so largely enter into the construction of all verbs, these terminations are unvaryingly used for the respective genders, except in some instances in Marathi, in which the incorporation of the substantive verb into the participle has, by the operation of euphonic laws, wrought a change in the vowel.

Taking then the terminations of the adjective as the central type, it will now be necessary to go through the range of substantive terminations in order, so as to get at a clear comparison of them all, and to ascertain which are regularly derived from the central type, and which are exceptions, to be accounted for in other ways.

§ 32 (1). The masculine termination d in H. P. M., and occasionally B. and O., corresponds to the termination o in S. and G. in a large majority of instances: as

This termination is in S. masculine, without any exceptions; in G., however, some words in o are feminine, in which the o is not the pratyaya, or formative syllable derived from the Sanakrit -as, Pr. -o, as in the above-mentioned class, but arises from some phonetic corruption of the root-syllable. Such are the feminine nouns.

G. 南西] "leech," Skr. 南南南 (f.).
G. 南] "mortar," "司((m.).
G. 南] "lirard," "別(f.) (田) for 利夏).

The number of these words is not large, nor are they in themselves important.

The termination in 4 exists throughout the whole seven languages, including G. and S., in certain words: these are—

- (a). Words derived from Skr. nouns in an, like राज्य, the nominative of which ends in Skr. in a. Such are राजा "king" (m.), in all; "WISHI" "soul" (m.), in all. Nouns neuter in Skr. of this form end in the short vowel, as जामन् "name," H. जाम, m. in all, except M. and G., where it is neuter. जिल्ला "greatness," however, is used as a fem. in H. P. and S., and as both m. and f. in M. G. has preserved the real gender of the Skr., in which language जिल्ला is masc.
- (\$\beta\$). Words derived from Skr. nouns in तृ, making their nominative in ता. Of this form are a great number of Tatsamas denoting the agent, as कता, दाता, etc.
- (γ). A few words of foreign origin, running through all the languages, and chiefly relating to males, so that they are masculine by natural gender. These are mostly Arabic, Persian, or Turkish, but have been in use in the Indian languages from very early times, and have even undergone some corruptions, as will be seen in the following list:

H. बाजा "master," " sir," II, P. जाजा, जाजा, S. जाजा, G. id.

H. बाबा "child," إبارا , P. id., S. बाबो, G. id., M. बाबा-

H. दाना "sage," ८०, P. M., S. दानात, दानाझ, दानझ, G. दानाव, दानो, M. दावा.

H. दरिया "river," ५,०, Р. दरिकाड, 8. दरियात, दरिकाज, 6. दरियात, दरियो, M. दर्यो.

H. उसरा "nobles" (pl., also singular), ", . of and उसराउ, P. उसराउ singular, S. उसराउ, का sing., G. उसराव, ०री sing., M. उसराव sing.

H. चुदा "God," مُخَدِ, P. id., S. id. and खुदाउ, G. खुदा, खोदा. M. खुदा-

H. दारोबा "averseer," क्रिक्रिंग, P. दरोबा, S. दरोबो, G. id., M. दरोबा-

The word SHCI, though really a plural, is constantly used as a singular in modern speech. It will have been noticed that

there is a tendency to add a u or v on to many of these words, and so to account, as it were, for their being masculine, by giving them the old masculine termination. G. also effects the same by boldly changing the final à into o.

(2). The termination I is the typical termination of the feminine in Tadhhavas and Dessias; that is to say, in nouns of the medieval and modern kinds, in which, as we have frequently before noticed, a principle of development prevails of a character essentially different from that which distinguishes the classical Sanskrit or Prakrits. In opposition, however, to this generally feminine character of t, a number of nouns are found in all the languages, which, though ending in I, are masculine. This class seems to have given some trouble to our grammar-makers, and their difficulty has been increased by the laxity of practice in some of the languages. Especially is this the case in Hindi, where, owing to the leading authors having been men of strong poetic instinct, but of little learning, a tendency has grown up to give to each word the gender indicated by its typical termination; and words which, from their origin, ought to be masculine, are sometimes found coupled with feminine adjectives or participles. This source of error is, however, confined to words which have only grammatical gender; those which are masculine by natural gender, as describing male beings or their occuputions, are exempted by their nature from the possibility of being mistaken for feminines.

Masculines in I may be divided into the following classes:

(a). Those derived from Sanskrit agents in ₹₹, which in that language form their nominative in ₹ f; as the modern languages ignore the grammatical fiction of a base, as distinct from the actual nominative, it is from the latter only that they take their forms. Instances of this class are the following (see also the list in § 18);

Skr. इस्ती "elephant," hanc इस्तिन् (m.), H. G. S. हाथी, P. इत्यी, M. इत्ती, B. O. हाती. Skr. खामी "lord," base खामिन् (m.). In all साई, except though in the commoner word गीखामी, which becomes in the modern languages गीमाई, M. has गोसावी.

Skr. साली "gardener," base मालिन् (m.). In all माली, but G. and M. माळी.

Skr. पची "bird," base पचिन्, H. पंछी, M. G. P. id., S. पंखी, B. पाखी, and in East-B. पाही.

Skr. साची "witness," base साचिन, H. साखी, and so in all.

There are, moreover, in this class many words of uncertain origin, as well as others whose origin is not at all uncertain, though, owing to phonetic changes, it is not so apparent at first sight. In some of these words we may attribute the form to a feeling that long f as a masculine was appropriate to names of trades or professions, so that it was added to words for which there existed no prototype in Sanskrit. Such are—

H. धोबी "washerman," and so in all. B. and O. have धोबा and धोपा.

- H. परवारी "village accountant," so in all, but rare in M.
  - H. प्रोडी "neighbour," in all, but more correctly with ₹.
  - H. मोदी "shopkeeper," in all, but S. मोटा.
  - H. QTET "a non-resident cultivator," so in P. B. O.

The exact form from which धीवी is derived is uncertain. It should be Skr. धाविब, from धाव "to wash," and the vulgar language probably used the word in this sense, though in classical Sanskrit the word seems to be used exclusively in the other sense of the root, namely, as "a runner." पाडी is from पाची, and that again from पांच, from un in the sense of a "side;" a pāht cultivator being one who lives, not on the spot, but in another village, and is thus, as we should put it in collequial English, an "outsider." प्रवारी is a somewhat abnormal compound of the mediaval period; the first part uz is from un

"a letter" or "writing," and the second seems to postulate a form चारिन "doer," perhaps from the root वृ. परीसी, more accurately परोसी, is प्रतिवासिन. मोदी has been by some derived from the Skr. मोदन "sweetment;" but I believe it really comes from the Arabic (عمر "provisions," "stores;" the ordinary Indian modi is not a sweetment-seller, but deals in grain, and estables of all sorts.

In a subsequent section (§ 35) it will be shown that the majority of these words testify to the existence of a Sanskrit original in (4), by forming their feminines in (4), or in forms derived therefrom.

(β). Nouns derived from Sanskrit substantives in 7, with the sense of a male agent. Here the gender is natural, not merely grammatical. Common instances are:

Skr. धातू "brother," H. भार, so in all, but P. also धाउ, S. भाउ, M. आख

Sir. जमु "grandson," H. जाती, so in B. and O., but M. जातू.

The number of words of this class is not large, nor do they run through all the languages; in fact, as has already been mentioned (Ch. I. § 14), the tendency of w is rather towards a in this class.

(γ). Words derived from Sanskrit masculines and neuters in
 t, by lengthening the final vowel; as

Shr. इध "curds" (n.), H. 국립 (m.), P. 국립 (m.), M. and G. id. but n., S. 국립 (f.).

Skr. ufa "lord" (m.), H. ual (m.), bat oftener ua-

Skr. अगिनीपति "sister's hanband" (m.), H. चहुनोई (m.), P. भन्नाई, O. भिनोई.

Skr. वर्धीक "carpenter" (m.), H. वहरे, O. B. M. id., but G. S. वाडी. which is an independent formation, from the modern verb "to cut."

<sup>\*</sup> The origin of the termination sard will be discussed under the Verb, to which it properly belongs.

(δ). Derivatives from Sanskrit masculines and neuters in (a).
(α) and (α). Concerning the former of these, see examples in Ch. I. § 18, (β), (γ). Of the two latter examples are:

Skr. पानीर्य "water" (n.), H. पानी (m.), and so in all, but generally पानी. In G. and M. it is m.

Skr. प्रिय " beloved" (m.), H. पी (m.), "lover," " husband."

Skr. श्रीविद्य "a class of Brahmans," H. सोती.

Skr. चविय "a Kahattriya," H. खबी, क्बी, क्की, P. id., S. खिबी, O. क्बी.

Under this head probably comes the list of obscurely derived words in Sindhi given by Trumpp at p. 96, though, with some three or four exceptions, the origin of these words is not at present traceable.

(e). Words derived from Sanskrit masculine and neuter nouns containing ₹ or ₹ in the penultimate syllable, but in which, the last syllable having fallen away through phonetic changes, the ₹ or ₹ has become final, the former being lengthened to ₹. Thus:

Skr. धूर्त "clarified butter" (n.), H. घी (m.), M. घी (n.) but rare, P. G. id. (n.),

Skr. जीव "life" (m. and u.), H. जी (m.), and so in all.

So completely, except in the case of professions and trades, has the idea of the feminine character of taken possession of the popular mind among the modern Aryans, that many words, which ought to be regarded as masculine, are treated as feminine, simply because they now terminate in t. Thus in H. was "butter" is found with feminine adjectives, though it is properly masculine, being derived from Skr. was (n.), and the corresponding word in M., with, is neuter. So, also, H.

<sup>&</sup>lt;sup>1</sup> The Sotis are one of the highest clams or getree among the Maithil Brahmans. The Rajas of Darbhanga belong to this potra.

विका "sale" is treated as feminine, though derived from Skr. विकास (m.). In M. several words which are neuter, of this termination, are written with anuswara as है, because the anuswara, being derived from the final म of Sanskrit, seems to the people to be more appropriate to that gender. Thus they write पाणी "water," मोती "pearl," and others. It is by the operation of a similar tendency that we in England now treat such words as riches, alms, as plurals, though they are really singulars corrupted from richesse, almesse; to also our old singular pease, from pisum, has been changed into a plural peas, and a singular pea formed from it, though the s has nothing to do with the plural sign, but is a genuine radical part of the word.

(3). The termination û T is masculine, as in the cases of the other long vowels, in words derived from Skr. masculines. rule is a good guide, in spite of a certain number of exceptions, in all terminations, namely, that the gender of the Sanskrit original is fairly kept in all modern words, and affords a clue to the many apparent irregularities; as, for instance, in the case of words like ची. पानी, etc. Inasmuch, therefore, as the termination T in Sanskrit is of all three genders, we cannot say that it is either regular or irregular for a word in any of the modern languages to be masculine, feminine, or neuter. We must in each case trace the word back to its origin; and we shall, in a large majority of cases, find the modern word retaining the gender of its parent. In Gujarati no distinction is practically made between long and short u; and even in Marathi some confusion exists. In Marathi, however, and Sindhi, the long & is generally masculine; in H. and P. words of this termination are about equally divided between the two genders. No examples of the masculine nouns of this termination need be given. The rules for the formation of the stem contained in

<sup>\*</sup> The translators of our English Bible know better when they wrote "an alms" (Acts iii. 3), though they use "riches" as a plural, "Your riches are corrupted."

the preceding Chapter will serve to guide towards the Sanskrit word from which the modern word is derived, and the gender can thus be easily ascertained.

(4). The short vowels are generally elided at the end of a word in Hindi, as well as in P. and G., and to a very great extent also in common Marathi. It will therefore be more convenient to reserve the consideration of such words till we come to the section on consonantal endings. When the short vowel is not elided, it is frequently lengthened, to enable it to retain its position, and the words in which it still remains as a short vowel are all Tatsamas, like nfa, fafu, ug, ug, the gender of which is identical with that of the Sanskrit.

It is only in Sindhi that short vowel terminations are of any account, and our discussion of them is confined to this language.

Short a T is the typical ending of masculines.

Short a w is the typical ending of feminines.

Short i T is chiefly feminine.

Masculines in 3 are derived from the Prakrit termination o, and represent the class I have called barytones in the last Chapter, thus corresponding to the masculine consonantal endings of other languages.

Under this head come also nouns derived from Sanskrit masculines and neuters in 3, thus-

There are also a few words in which the final a is derived from the g of Sanskrit, as quoted in Ch. I. § 14, fug = fug, etc.

There appear to be no instances of masculines in a अ, and very few in इ. Of the latter, instances are पर, from Skr. पति "lord;" विरसपति, from Skr. बृहस्पति "the planet Jupiter;" परि

This is Trumpp's derivation (Sindh) Gr. p. 43). I am disposed to derive the word regularly from Skr. 研究, Pr. 研究).

"Vishnu;" and as shortenings of t from 東河, as noted above in (2, a), 強調性 from 強調性可 "lion;" 報期性 for 報酬性, from 報酬性 "helper," are familiar examples.

§ 33. As in the masculine, so also in the feminine terminations, there exists a double system. The termination d, which is typical of the feminine in Sanskrit, is in the modern languages a resultant from e, and typical of the masculine; yet it is found as the termination of many fem. words, just as t, the modern fem. type, occurs in many masculine words.

(1). Final à is feminine in the seven languages in the follow-

ing classes of nouns,

(a). In Taisamas which are feminine in Sanskrit, such as पूजा "worship," বিবা "thought," বেবা "tongue," ক্যা "story," and many more very common words.

(β). In a considerable number of modern Tadbhavas, which, though changed from the pure Sanskrit form, still retain the distinctive termination, and with it the gender: such na

Sicr. चुना "patience" (f.), H. क्निंग, क्रुना, P. S. जिना, G. जना,

Skr. याचा "pilgrimage" (f.), H. बाचा, P. जातरा, S. जाटरा, G. id., also जातरा, M. जचा, all f.

Skr. चुधा "langer" (f.), H. खुधा, P. खुडि आ-

Sicr. आचा "order" (.f.), H. चास्या, P. चास्या, S. चास्या, G.

Sir. 301 "murder" (f.), S. 341.

(γ). In some words of uncertain origin, but purely local in type, as—

II. (名词句 (元), "a small box," but in all the rest m. in d, with a fem. in L.

H. चिडिया (f.), "a bird," in P. and M. without the final syllable and f. H. बडिया (f.), "an old woman." 160 GENDER.

In these three very common words the final या is probably a recent addition, and the words were originally, as they are still in the cognate languages, दियो, विद्यो, and पुदी, the i having been shortened, as is usual in Hindi, in consequence of the additional syllable. Or we may suppose them to come under § 9 (2), and to have been feminines of the form मिचना, where the suffix that has been softened into iya, though it would be useless to look for a Sanskrit original for the two first words. The third may, however, well come from a Skr. form पुरिचा.

This remark leads to a consideration of somewhat extended application. It may be asked why d, which is in Sanskrit a fem. ending, should in the moderns be so typically and universally a mase, ending, and similarly why t, which in Skr. is quite as much a mase, as a fem, ending, should have in the moderns so almost exclusively attached itself to the fem.? The answer. would appear to be found in the extreme prevalence in Pr. of the practice of adding the suffix ake to nouns of all classes. We have to begin with the oxytone nouns in Skr., which become nouns in o and d in the moderns, and to them we must also add the Pr. formatives in aka=ao, of the type ghotaka= ghorao = ghora; the union of these two sets of words results in a preponderance of mascs, in d-o. Now, as the feminine of aka is ika, and ika becomes iya, and more frequently still i, if we suppose that to every one of the words to which Pr. tacked on also for the mass., it also tacked on ika for the fem., the preponderance of f as a fom, ending in the moderns is explained, the more so that we can add to the I from ika a large class in which already in Sanskrit the masc, in -as forms its fem. in #; such as 明天(: (m.), 明天() (水). Moreover, the typical ending of the adjectives being d-o for the mase,, and I for the fem., it was natural to use an adjective ending in I, with a substantive of a similar termination; and so it comes to pass that all grammarwriters treat masculines in I and feminines in I as exceptions, though few of them attempt to account for their existence.

(2). Final i is feminine then in all cases except those noted in the last section, and this holds good for all the seven languages. Final à is feminine in words derived from Sanskrit feminines, as মু "earth," বযু "daughter-in-law," H. বল, P. বাল, S. বল, etc.

In Sindhi, as noted above, the feminine terminations are a and i, and the majority of these words are identical with the feminines in mute a of the other languages, which have been shortened from Skr. feminines in a.

(3). In some classes of adjectives, mostly very common and vulgar, a feminine in a is found. This is very common in Panjabi, and frequently with the suffixes 事, 更考, or 更美, where the a may be regarded as a lengthoning of the s of the masculine. Such are—

धनेलो "(a cow) that thrusts or butts," masc. धनेल्.

चुड्डी "whore," from चुड्ड "cunnus," also written सुङ्घी. सुद्धी. and

जर्ती "adulteress," from जतवा "to copulate," masc. झन्न,

हाँदी "a woman with projecting teeth," from देंद्र "tooth," mase. दांद

गछरेजी "a coquette," origin uncertain.

गाजो " an immodest woman" (probably from गाज, for खाज = सक्ता).

Most of the words of this form are words of abuse used by women to one another, the fair sex in India being possessed of a remarkably fertile invention in the matter of vituperation. In Marathi also in is often a feminine ending, as in arguin "woman," where the o is probably a lengthening of the masculine II. In Oriya, when addressing women, they always use II.

5 34. The neuter has less variety of termination than the other genders, and exists only in Marathi and Gujarati. The type of the neuter is M. 4, G. 5, but M. also has a neuter in 3.

Vid. 11.

11

162 GENDER.

which, however, is not frequent, and occurs principally in words denoting the young of animals, which have also musc, and fem. forms for the two sexes of the animal; as चकरा (m.) "he-goat," चकरा (f.) "she-goat," चकर (n.) "a kid of both sexes."

Both the typical terminations point back to the st of the Skr. neuter, that of G. in st, by virtue of the process so often observable in the case of final st, by which that letter resolves itself into its two elements, the labial and nasal, the former of which passes through st into st, and the latter into anuswars, and then into anunasika or a simple nasal breathing. The st of Marathi would seem to be derived from a weakening of the work into st.

Though the other languages have no neuter for the noun, yet the infinitive, which is a verbal noun, is derived from a Skr. neuter, and in most of the languages retains a neuter form. Hoernle (Journ. As. Soc. Bengal, vol. xlii. p. 66) combats the theory that the neuter form observable in Old-Hindi, and in several dialects of Modern-Hindi, as well as in G. and M., and he might have added in Sindhi also, is derived from the Skr. neuter in w. Thus he will not take Old-H. will, dialectic करनी, करना, करने, from Skr. करण, as he says the process is opposed to certain glottic laws which he appears to have formulated for himself. He would apparently derive the Marathi infinitive कर्ब from a Prakrit form करियक; and the other infinitives with a labial type, as acrif, from a further Prakrit form word. The phonetic changes thus indicated are indeed possible, and quite regular; if we once concede Prakrit forms कर्णिय and कर्गार्थ, there is no difficulty in deducing from them modern forms इर्गों and कर नी respectively ; but we want more evidence as to the said Prakrit forms, and their meaning hardly corresponds with sufficient accuracy. But leaving this question of the infinitive for its proper place, we may follow Hoernle in his process of applying the principle

to nouns in general. No such general ending in Two or WW is of course to be found in Prakrit for neuter nouns of all kinds; but the author would have us believe that such an ending did exist in a great many cases, and that its origin is to be found in the favourite suffix W, so that we are to postulate in the case of every Marathi neuter in v a Prakrit form in vv, derived from (4, and in the case of every neuter in 3 or 3, a similar 34 from 34: why Marathi should always select 74, and Gujarati 34, is not explained, and seems in fact unexplainable. It is, however, highly probable that we have in this theory an indication of the direction in which we should search for the explanation of such forms if dissatisfied with their derivation from the simple Sanskrit neuter; and it must be admitted that the author's illustrations from the forms of the oblique eases of stems in & in Marathi are strongly confirmatory of his theory.

§ 35. A large majority of feminines in all the seven languages are formed from the corresponding masculine nouns, though there are of course many which have an independent origin; as, for instance, words which possess natural gender, in which the female animal has a distinct name from the male one. But in names of trades, castes, and the like, the female is generally derived from the male.

Masculines in \$6.8., or \$4 H. and the rest, form their feminines in \$1 as

This is an extremely common process, based on the typical endings of the two genders, and need not be further illustrated. It is extended also to the case of masculines ending in short a in S., and with mute a, or in other words, with a consonantal ending, in the other languages. Instances are:

8. पुर्दे "washerman,"	परि "washerwoman."
S. गड्ड "he-ass,"	गद्धहि "she-uss."
8. भी व "firms,"	घीरि "firma."
P. कुमाद "sugar-cane,"	कुमादी id.
P. 勇研單 "vetch,"	कुलची td.
P. कीड "a cowry,"	कोडी "a small cowry."
H. बन्दर "monkey,"	बन्द्री "she-mankey."
H. बन " forest,"	यनी "copse."
H. artar "humbon "	with a date " a read "

Although, however, instances are to be found, such as those given above, of a feminine in  $\xi$  being derived from consonantally ending masculines, yet the practice is not very common, the feminines in I being more generally derived from masculines in  $\delta$  and  $\delta$ ; especially is this the case in masculines derived from Skr. by means of the common suffix अब, which, as has been shown, produces अबी, and then बो and बा, while its feminine is regularly का, yielding इया, and then  $\xi$ , as in बोटक, बोडबो, घोटा (m.) "herse," घोटिका, घोटिका, घोटी (f.) "mare."

Extremely common, and spread throughout the seven languages, is the feminine ending whose varied forms are given below, and which is confined to the expression of nationality, caste, occupation, bodily and mental qualities, and other attributes of living, and chiefly human, beings.

H. has, in the first place, feminines in इन, इनी or जी, derived from Sanskrit इनी, the feminine of masculines in ई (इन); thus

Skr. हसी "elophant," H. हाथी, Skr fan. हस्तिनी, H. हाथिन.

This form it also uses in feminines derived from a masculine in t, which t is thereby shown to represent the Skr. et as

धोबी "washerman," धोविन "washerwoman;"

भावी "gardener," साजिन and साजिनी "gardener's wife;"
but the termination is by no means confined to those words
which have in Skr. the form इन् (m.), इनी (f.), but, like all
terminations which have once become typical, is added to words
derived from all sorts of formations; thus

सीनार "goldsmith" (Skr. सुवर्णकार), सुनारिन "goldsmith's wife."
चमार "leather worker" (Skr. चर्मकार), चमारिन his wife.
कुन्हार "potter" (Skr. कुमकार), कुन्हारिन his wife.
वाध "tiger" (Skr. बाझ), वाधन, बाधनी "tigress."
कुंबिन the female of that

Through the habitual carelessness of this language in respect of unaccented short vowels, this termination is often sounded merely as ws.

कुंत्रहा "a seller of vegetables," कुंत्रहन and कुंत्रहन "a female seller." ब्याना "cowherd" (Skr. बीपानक), स्वानन and व्यानिन "cowherd's wife."

हन "cheat" (Skr. खन). उनन and दिनन "female cheat," or "a than's wife."

पापी "sinner," पापन, पापिन, पापिनी "peccatrix."
बरेडा "washerman," बरेडन his wife.
बढर "carpenter," बढन his wife.

In this latter word there has been contraction from चढदच.

Regular derivatives from the Sanskrit are the words indicative of conditions peculiar to females:

Skr. गर्भिणी "pregnant," H. गामिन and गाभन.

So also a feminine in रून, सन, or जी, may be made out of all sorts of masculines, to indicate the wife of a man of any class or

trade, rather than a woman who practises the trade herself. Thus one often hears familiarly witelf "a thief's wife," from wit "a thief." This does not necessarily imply that the woman is herself a thief, but that her husband is. The same remark applies to the following:

पंडित "a Pandit," पंडिताणी his wife.

गुरु "a teacher," मस्वाइन his wife.

उाकुर "a chief," उाकुरानि and ठाकुराइन "a chief's wife."

चीधरी "a headman," चीधरानि and चीधराइन "a headman's

These forms wife and wige are from Skr. wiel, the latter by a common inversion. They are even added to words of Persian origin; as

"a sweeper," मेहतराणि "a female sweeper." "a Maghal." मुगलाणि "a she-Mughal." ्रीक "a servant," चाकराणि "a female servant."

Even in words ending in at we have the feminine ending

वनियां " trader," वनियाइन "a trader's wife."

The Muhammadan government conferred the title of Khan is on Hindus in some parts of Bengal, and from this the common people have formed a scarcely pronounceable feminine. Khan throughout India is pronounced with the final a masalized, as though written et, and the feminine is therefore entry vulgo entry or entry, which the reader may pronounce at his leisure.

Panjabi has also this method of forming the feminine, and chiefly neglects the  $\xi$  and uses the termination uv or uv, the former used after a cerebral, the latter after other letters, a practice in which Panjabi reverses the Skr. usage. The application of this feminine ending has grown to be irrespective of the termination of the masculine, as in H. This will be seen from the following group of examples:-

धोबी or घोवा "washerman," धोवण his wife.
धोही or घोहा "a cheat," घोहण id. (f.)
कुडडी "leprous man" (Sicr. कुडी), कुइ रन "leprous woman."
कुसाथी "had companion" (m.), कुसायण id. (f.)
करोधी "angry" (Sicr. कोधी), करोधण id-(f.)
धांदळवा "tricksteer," घांदळन "trickstress,"

The intelligent and progressive caste of Kayasths, which is so leading a class in Bengal, is very scantily represented in the Panjab, and the name is somewhat corrupted.

काइय or काइय (m.), काइयगी, काइयागी, काइयागी, and का॰ (f.).

मी is used also alternatively with चर्या, as
चोधरी "headman," चौधरणी, चौधराइया his wife.
करसान "peasant," करसानमी id. (f.)
मुखार "villager" (Skr. सामवारी, )
मुखार "villager" (H. गांवार),
कभीन "menial," कभीनमी id. (f.)
उग "cheat," उगमी his wife.

From the feminine again, by some forgetfulness of its origin, has been formed a masculine 3701; so deeply scated is the feeling that a feminine in & corresponds to and postulates a masculine in d. Precisely in the same way in Latin the feminine manda, literally "manned," from mas, maris, has given rise to a masculine marifus.

Persian and Arabic words also undergo the prevailing Indian conversion into feminines. Hence spring the common but curious hybrids—

गुसेल "angry," i.e. Arabic र्ट with Aryan एक. fem. गुसेलया-जनाद "executioner." Arabic र्ट fem. जनादणी his wife. जारीगर "artificer," Persian र्ट्र हिला. जारीगरनी his wife. 168 GENDER.

करजदार "dehtor," Ar. and P. قرض دار fem. करजदार्गाः करजारे id., corrupt Arabic نرضای fem. करजारणः

Masculines in चाई shorten the ई and add स for the fem., as धरवाई "welghman," धरवाइस his wife.

When a word of this form ends in anunusika, that is rejected, as
मुसाई "devotee," नुसाइस his wife.

So also with words ending in आ, as बिल्या "merchant," fem. बिल्याइल, बिल्याली "a merchant's wife." In P. as well as in H. this feminine termination implies rather the wife of a man who is described by the mast, word, and not a woman who herself does the thing implied, as in the H. instance of चोर्बी, which does not contain any imputation on the honesty of the lady so styled, but on that of her husband.

Sindhi affixes this group of terminations to masculines of all sorts; thus it is added in the forms for and off to masculines in short u; as

बदु "a Jat," बटिश and बटिशी, also बट्यायी. "a Jat's wife." बरोचु "a Beluch," बरोचाणि his wife. सींड "lion," सींहणि "lioness."

To masculines in o, but less frequently than the fem. in ₹: as अंघो "a drummer." संघिषा, संघिषा, संघाषा, वाधावणी, and संघादणी, his wife.

Trumpp teaches that in the case of masculines in short u, as ms, the final u is changed to t, before adding the fem. termination; but if this were the case, we should have a double feminine. In the cognate languages, where the masculine ends in a consonant, we have feminines in the termination, and mixing should be divided thus: mx + the termination, and mixing should be divided thus: mx + the masc base the original Skr. of this form we have the masc base that the other cases retain it, and it must therefore be regarded as the

true ancient form, and the feminine sign would be only \(\mathbb{T}\); but the modern languages having got hold of \(\mathbb{T}\), and regarded the whole of it as the feminine termination, have tacked it on to all sorts of masculines. The only real instance of a double feminine is in such words as \(\mathbb{Z}\) unit which is doubtless \(\mathbb{Z}\); \(\mathbb{T}\) and \(\mathbb{M}\). A similar confusion of forms gives \(\mathbb{M}\) unit where there is \(\mathbb{M}\), the original or regular fam. of \(\mathbb{M}\), with the \(\mathbb{T}\) changed to a semivowel before the fem. ending \(\mathbb{M}\), which again has been regarded as in some way connected with \(\mathbb{M}\), and has thus come to be pronounced as \(\mathbb{M}\)\(\mathbb{M}\), or perhaps \(\mathbb{M}\) and has thus come to be pronounced as \(\mathbb{M}\)\(\mathbb{M}\), as in the other languages, Sindhi has chapped on final \(\mathbb{T}\) from a feeling that the word is feminine.

In the case of masculines ending in a, this vowel is shortened to w or elided altogether, and the phrase, "a Hindu female," may thus be expressed in six different ways; thus

# हिन्दियो, हिन्दिणः हिन्दुयो, हिन्दुणाः हिन्दुचायो, हिन्दुचार्णि.

Gujarati has the terminations in considerable variety, as आण, एण, आणी, भी and भी, of which एण is peculiar to this language. Examples are:

गोली "servant," गोलगा "female servant." भोषी "washerman," भोवग "washerwoman." कोळी "a certain caste," कोळग a woman of that caste.

Taylor (p. 28) gives also feminine forms धोवख, कोळख: but these are not noticed by Narmada Shankar. They might arise from the final द of दूनी being shortened to the semivowel; and the form एस is from आनी, Pr. आसी, through the H. inversion आदन. Gujarati retains the Prakrit form of the must स.

वाणियो "trader." वाणियमः वाणियामः वाणियामः वाणियामः वाणियामः वाणियामः वाणियामः वाणियामः वाणियामः वाणियः वाण्यः वा

It appears that in cases where there are two forms of the feminine for the same word, one form is in use in one part of the country, and the other in a different part; but it is not stated which form is used in any specified part.

Marathi in particular affects a long vowel in the final syllable of words ending with a consonant; and in the class of words now under consideration it accordingly takes regularly देश in the feminine nominative, but shortens this ₹ to ₹ or ₹ in the oblique cases, because this syllable is no longer final in those cases. Thus we have—

मुगर "skilful man," सुगरीय "skilful woman," "a good housewife." भावी "devotee," भावीय "female devotee." वाघ "tiger," वाघीय "tigress." कुणवी "peasant," कुणवीय his wife.

Sanskrit feminines in tel, whether they have any corresponding masculine in Marathi or not, are treated by it in the same manner as the above:

कुटीया "procuress," Skr. कुट्टिकी बहीया "sister," " भगिनी

With regard to O. and B., as they have no means of indicating gender, so also they do not possess any regular method of forming feminines. In modern times a large number of Sanskrit feminine words have been dug up out of dictionaries, and are now used in their Tatsama form; and there are old Tadbhavas, like the word for "sister," which have not been formed from masculines in any modern language, but have come down ready made from ancient times. Of these it is unnecessary to say anything.

Nor need we here introduce those words which are names of female animals, the male of which has a different name; like H. अ. "ox," with "buil," " "cow." Each of these words stands on its own basis, and descends from some Skr. word which has no connexion with the masculine.

§ 36. With regard to the gender of that large class of words which, in all but Sindhi, end in mute a, or in other words in a consonant, I am convinced that it is quite impossible to lay down any law. Each word must be traced back to its Sanskrit or other origin, and the reason for the gender will then be apparent. A large number of these words have come to their present shape from rejecting a final à or other feminine ending in Skr. (see the remarks in § 11), and it is therefore mere waste of time to attempt to find out any rules founded on the consonant which has thus accidentally become final. Stevenson, in his Marathi Grammar, occupies several pages with lists of feminines ending in a consonant, which it would be impossible for the student really to carry in his memory; practice alone in speaking the language can teach him the gender of these words. It is of little consequence to know the gender in H. or P. In the forms of Hindustani spoken all over India, gender is habitually neglected by all classes, and it is only in the area in which Hindi is the mother-speech that much attention is paid to it, and even there only by purists or accurate speakers. In a great portion of Bihar one hears such phrases as तुद्धा मा आता है "your mother is coming;" and in the Parbatia or Nepali dialect, gender is not preserved at all. It exists, however, in literature, and its existence cannot therefore be ignored in Hindi even; and correspondents in the Marathi country and Gujarat inform me that the threefold gender of those languages is always correctly used, even by the lowest and most ignorant peasantry-an assertion which I should heaitate to receive in its entirety until confirmed by actual observation.

In Marathi gender is distinguished by native grammarians in three ways, and the rules which they lay down are useful as far as they go, though necessarily incomplete, and leaving much that is unclassified. They distinguish gender—(1) by signification, (2) by form, (3) by both combined. Of these three, the second, or that by form, applies only to the termination, and 172 GENDER.

breaks down as soon as it gets from words ending in a vowel to those ending in consonants. It is a good guide for vowel-endings, and consequently embraces the whole of Sindhi. In Marathi it helps us to some few rules for consonantal endings. Thus nouns in an are of course feminine, as shown in the last section; so also are those in we and an It is also asserted that nouns in at, that is a preceded by anunasika, are masculine; but there are so many exceptions to this rule as to destroy its value for practical purposes. Similarly untrustworthy is the rule that nouns in \(\tau\_i\), and \(\tau\_i\), when forming the last member of a nexus, are neuter; for thereupon follows a long string of such words all masculine.

In all the languages the large class of stems in  $\Xi$ , mentioned in  $\S$  9 ( $\beta$ ), is chiefly feminine, but contains enough masculines to render it unsafe for a foreigner to treat all such words as feminines in speaking the language.

Reduplicated nouns are nearly everywhere feminine; but as many of these have vowel-endings, they come under head (3), which is a very perplexing method indeed, and leads to more confusion than either of the others. The only really trustworthy rule under this head is that which prescribes the gender of abstract nouns; those in very being neuter in those languages which have the neuter gender, and masculine in those which have it not. The masculine in all, and the feminine, as in Sanskrit.

Under head (1) we are led into a maze of conflicting considerations. Leaving out, as sufficiently accounting for themselves, words which have natural gender, the artificial gender reminds us of the incoherent old "Propria quae maribus" of our school-days. Winds, mountains, rivers, periods of time, and the like, appear to range themselves under various genders with a most inextricable caprice, and the usual tagrag of exceptions hangs on to the skirts of their army like a mob of unruly camp followers. No one perhaps really believes that the speakers

who unconsciously developed their respective languages ever stopped to think what the gender of a word was, or intentionally made it masculine because it was a mountain, or feminine because it was a tree or a river. The utmost we can admit is that instinctively large coarse strong things were treated as masculine, and their opposites as feminine, while things really or constructively inert were usually speken of as neuter.

It will perhaps be safer to conclude that all words whose gender cannot be ascertained from their present form must be traced back to the older form, where they will generally be found to be in possession of a termination which at once explains the reason of their modern gender.

Even this rule, however, is not free from exceptions, for there are not wanting words which, though clearly derived from Skr., have changed their gender in the course of ages. Especially is this the case with words denoting the body and its parts, where a sense of tenderness or familiarity seems to have operated to cause them to become feminine, that gender being used to denote small delicate objects. From the same sentiment the Romans turned the names for parts of the body into diminutives, as auricula, occilus, and the like. Instances are—

Shr. 文章 "body" (m.), H. 文章 (f.), P. and G. also 文章 (f.), but in M. it is more., and S. 文章 (f.), where the fem. 頁 has been added.

Skr. 別以看 "oath" (m.), H. 崔寶 (f.), so also is the late Tadbhava 田以東: M. 別以司 is m. and f. when meaning "an ordeal," but m. when meaning "a curse."

Shr. আঘ "eye" (n.), H. আঘ (f.), P. মকুর (f.), G. আঘ (f.), S. অবি (f.), where the retention of the final হ has probably led to the word being considered as fem. Chand uses আঘ (= আবি).

Skr. आसय "sickness" (m.), H. आंद (m.) "mucous excrement," M.id. (f.), and S. ऑंद (f.).

Skr. बाह्र "arm" (m.), H. बाह्र (f.), P. id. (f.), S. बाह्र (f.). In G. it is f., but takes a fem. ending बाह्री; so also in M. बाह्री (f.).

Skr. वसु "thing" (m.), H. बसा (f.), P. वसत (f.), S. वसु (f.), G. वस (f.), M. वसु (f. and m.), वसु (f.).

Skr. विष "poison" (n.), H. विस. विख (m.), S. विखु. विक्र (f.).

Skr. अंच "entralls" (mostly in pl. बंचािंक्) (n.), H. अंतर, आंत (मी. also with fem. ending बंतरी and बंतडी. S. आंडी (m.), M. आंत (n.), G. बंतक्(n.).

Skr. 되ਰ "root," "metal," "element" (m. and m.), H. घात (允)
"semen virile," S. ঘানু (允), P. घात, घांत (允), G. घात, घानु (允),
M. id. (允 and m.).

The following are from Sindhi; they are all feminine, though the Sanskrit original, and in some cases the derivatives from it in the cognate languages, which I have added to Trumpp's list, are either mass, or neuter;

- S. चामु " offspring," Skr. चाम, H. चांस (m.), and so in all.
- S. बिंदु "scuren," Skr. बिंदु (m.), H. बिंद्, बूंद (f.), बिंदी (f.)
  "drop;" in which sense S. has also बिंदी (f.), M. बिंदी (f.), G. बिंदु (n.),
  probably because उ in G. is the regular neuter ending, and the u of this
  word has been confounded with it.

Trumpp here inserts S. पूनच (f.) and पूनक्, which he would derive from Skr. पून्च (m.), but this is apparently an error; the word should be derived from Skr. पून्चा or पून्चिमा "the day of the full moon," which is feminine in Skr., and carries that gender into S. Stack writes it पूनच, and gives the forms पूर्यमानी, प्रामानी, प्रामानी, etc., which exist in all the other languages.

S. तेंदू "thread," "wire," Skr. तेतु (m.), H. तांत (m. and f., but I think more usually f.). G. M. id. (f.), P. तांत (f.), तंद् (f.), and तंदी (f.) "catgut." In all it has frequently the sense of the string of a musical instrument, as a late, etc.

S. युषु "woman's milk" (f.), from Skr. सूत्र (m.) "breast." S. has

Trumpp, Sindhi Gram. p. 89 et seqq. Only such words have been taken from the list as show a change of gender from Sanskrit to Sindhi.

also खुणु (m.) in this sense, and H. खान, चन (m.). In Modern-H. the form खन is usual, but Chand has—

#### इक्क धान पथ पान॥

"From the same breast drank milk," literally (there was) a drinking of milk,—i, 170, 7.

S. 菊香 "sealing-wax," Skr. 菊青 "lac" (m.).

S. इंडू "ringwarm," Skr. इंड् (m.), H. दाइ (m.), G. दाइर (m.), M. दाइ (f.), दाइड (n.). "The feat gender of दाइ in M. is probably due to the existence of the Persian और "justice," which, like all Persian words in इ. in M. is treated as a feminine. P. इंड is however f. also.

S. 司官 "potash," Skr. 司飞 (m.), H. 司飞 (m.), M. id.; in some senses it is m., in others f. P. 司飞 (f.), G. 司飞 (m.).

S. 郭袞 and 워明 "dirt," Skr. 初前 (n.), H. 워明 (m. and f.), M. 워丽 (m. and f.), G. 和35 and 워明 (m.), P. 和35 and 和明 (m. and f.), 和35 however is always f.

S. 医寰 "assafertida," Shr. 恒豪 (m.), H. 副和 (m.), P. 慢和 (f.), M. 慢和 (m.), G. 慢和 (f.).

Sindhi does not always stand alone in its change of gender, and it will have been noticed that the various languages are capricious in their use of gender as regards these words. Most of the instances given are monosyllables, and there is a tendency in all the languages to regard monosyllables, or nouns whose final a has become mute, as feminines. It would seem also that there is a faint and not easily definable tendency to attribute a feminine gender to certain consonants, as § and 7. This may have arisen from the fact that a majority of words ending in those letters are really by origin feminine. Although the stuff and backbone of these seven languages is pure Indo-Germanic, yet we must not ignore or underrate the influence which Arabic vocables have exercised. This influence began in Sindh so early as Muhammad Kasim's conquest of that

176 GENDER.

country in the early part of the eighth century. Mahmud of Ghaznin's numerous expeditions extended the knowledge of the sacred language of the Musulmans to all Western India in the eleventh century; and by the middle of the thirteenth, Arabic words were heard in almost every city and town. Our seven languages were then only just growing into their present shape, and Arabic words were thus woven in with their structure as it grew. The idea of Hindi or Marathi ever having been without these words, is a mere dream of Sanskritizing purists. In the most obscure corners of rural India these words are heard, and it not unfrequently happens that the old Arabic term is more familiar to the masses than the grand new-fangled Sanskrit word invented by the Pandits. Thus the somewhat hybrid word, Alex jurimana, is used in the sense of "a fine," and is understood everywhere, while the newly-coined waters is not. Now in Arabic the termination - is distinctly feminine; in fact, it is the regular method of making feminines from masculines: thus, عَدَالَت , نُوبِت , فُرِت , بُرِكْت , بَرَكْت , and many others of the same kind being feminine, there would doubtless grow up an impression that whenever a word ended in t it was feminine; and as the masses know nothing and care nothing about derivation, the use of that gender would extend to all words in t, no matter whether of Aryan or Semitic orgin. This final is in Arabic often written as &, though still pronounced f: thus we may write Coop or Loo, both pronounced by Arabs daulat. In borrowing these words, the Persians frequently pronounced the final as h : thus we get arjah, martabah, and the like. From the frequency of these words an impression would, as in the case of t, arise that there was something inherently teminine in final h, and we thus account for such words as 27, 477, being feminine. In some of the languages these words having become, by usage, thoroughly feminine, have had one or other of the vowel-endings peculiar to that gender added to them, as in S. 218 and others.

With regard to the other changes, which are less easily explainable, we must, I think, have recourse to the argument that the medieval Aryans, before entirely doing away with any peculiarity in the structure of the ancient language, began to be careless about its use, just as in the Merovingian period in France, the Latin case-endings were used carelessly one for the other, till confusion resulted in their eventual abolition. So in the decay of gender, which has evidently taken place in the Indian group; the first step was a careless and irregular use of the genders of individual words, by which, if any one word of very common usage were feminine, a whole group of other words of similar sound would be made feminine too, and the same with any familiar musculine word.

§ 37. That the use of gender has shown signs of becoming less habitual, and gradually dying out, is undeniable. While it has died out entirely from B. and O., it is not much regarded in H, and P., and only two genders remain in S. The full range of three genders remains only in M. and G. When we cross the frontier into the territory of the Iranian languages, we find no gender at all. To ask why this is so, would be to ask a question which is virtually unanswerable. The neuter is certainly a very useless abstraction, and it is not surprising to find it the first to be thrown aside. In the modern Romance languages this has happened as much as in all the modern Aryan languages except G, and M., which have no parallel except in Modern High German. In the Indian group, the Prakrits retain all three genders; but the earliest mediaval Hindi has only two, the masculine and feminine, and even these two are much confused. It can hardly be said that Chand deliberately means to use a neater, when he claps on an anuswara to a formiess nominal stem to eke out his metre, or uses a word in its original Senakrit form, as in the lines178 GENDER.

### प्रथमं भुवंगी मुधारी यहंगं॥ जिने नाम एकं चनेकं कहंगं॥

"First (there is) a taking of the well-adorned Bhujangi, Whose name (though) one is taken in many ways."—i. 5.

Here the numerous anuswaras are introduced merely to make the line sean, the metre being U--IU--IU--I and a nasal is commonly doubled by prefixing anuswara: thus यहंगे is to be read as though it were written यहत्रम, and प्रथंगे as yuma. Frequently, too, we find a masculine participle or adjective with a feminine noun. Thus, while in one line we have प्रव होत मह सला !- where मह "she became" agrees with Titufa "queen" in a provious line-there occurs, a few lines below, क्या दियी बदोह "the bride made lamentation," where the verb is masculine, and in the next line walf "took," which is also masculine, refers to the same noun wart. The same indifference to gender, even with living beings, exists occasionally throughout the poem, and it may therefore be concluded that at that age, or before it, the strict observance of the three genders of Skr. had ceased to be usual. The masculine being the most common of the two genders that remained after the disuse of the neuter, gradually absorbed the feminine in ordinary writing, unless there was any special necessity for the employment of the latter, as, for instance, in the case of living beings. While, however, the poets retain tolerably accurately the two principal genders, the people must have grown careless about them at a comparatively early date; for Nepali, whose origin as an independent language dates from a.p. 1322, has little or no cognizance of them; and the earliest Bengali and Oriya poets, who wrote in the first part of the fifteenth century, show no traces

<sup>&</sup>lt;sup>1</sup> Though we may have argue that we have an instance of the objective construction, though the subject is not, as it should be with that construction, in the instrumental. It will, however, he sees from Chapter III. § 57, that the early and mediaval poets regularly omit the instrumental in the objective construction.

of the feminine as attached to anything but living beings. Grammatical gender had perished in the eastern area of the seven languages, then, by the fourteenth century, leaving only natural gender, and even that but indifferently attended to.

It is not surprising that Bengali and Oriya should have lost the distinction of gender earlier than the other languages, seeing that they had so little occasion to use it. In these two languages the participial forms of the verb, which have in the other languages usurped the place of nearly all the old synthetical tenses, do not exist; and by their absence a great and constantly occurring necessity for the use of gender was taken away. Thus in Hindi the verb has only one synthetic or Prakritic tense remaining, namely, the indefinite present, the third person singular of which ends in  $\mathbf{v} = \mathbf{v}$ , as in  $\mathbf{v}$  "they do." All the other tenses are formed by participles: as

Although the future is not a participle, but formed by adding at to the indefinite present, yet this at, like the terminations of the present and future, changes its vowel for gender and number, and makes a feminine at, pl. on at, f. at. So that in all three tenses there exists a necessity for remembering the gender, so as to make the verb agree with its subject or object, according to the nature of the construction.

But in Bengali there is no such custom, thus;

B. Aorist जरि, 0. जरह.

" Present जरितेष्ट्रिः " कर्माष्ट्रिः

" Past जरिजः " करिजः

" Future जरिजे or \*चेकः, " जरिजः

None of these tenses change their form in any way for gender,

180 GENDER.

and there is therefore no need to remember the gender of the subject; the objective construction also is fortunately unknown in those two languages.

If to this potent reason for disuse of gender we add the universal shortening of final long syllables, which led ultimately to their suppression, it will be readily understood that languages, which had no means left of marking gender, should soon cease to be aware of its existence at all, and in this respect should go even further than English. While our language retains distinct words for natural gender in the pronoun of the third person, these two do not; it means "he," or "she," or "it," and all the cases of this pronoun are the same throughout, as will be seen more in detail in the Chapter on the Pronouns.

Seeing how much the existence of distinctions of gender tends to make a language difficult to foreigners, it is not perhaps a mistake to regret that all the seven languages have not followed the example of these two, and got rid of gender before literature stepped in to arrest their development, and stereotype the forms they at present possess; and we may certainly set our faces against the obnoxious pedantry of some modern Bengali writers, who, in resuscitating a Sanskrit adjective, bring back with it the gender which the spoken language has long ago got rid of.

### CHAPTER III.

#### DECLENSION.

CONTENTS.—§ 38. Inflection.—§ 39. Preparation of the Stem in Orita and Bengali.—§ 40. The same in Hindi and Panjabi.—§ 41. The same in Guzabati, Marathi, and Sindil.—§ 42. Numbrale.—§ 55. Arealyr.—§ 56. The Origine—§ 57. Instrumental.—§ 56. Arealyr.—§ 59. Gentive.—§ 50. Locative.—§ 51. Acceptive.

§ 38. The modern noun in all the soven languages has the same number of cases as in Sanskrit, nominative, accusative, instrumental, dative, ablative, genitive, locative, and vocative. In Sanskrit these cases are distinguished by changes in termination, as naras, naram, narena, naraya, narat, naras, nara, nare, nara, naraya, narat, naras, naras, nara, nare, nara, naraya, narat, naras, naras, naras, naras, naras, naraya, narat, naras, naras,

civilized desert-tribes. It is false philology to say that to Sindhi must be assigned the first place among its sister-tongues, because it "has preserved an exuberance of grammatical forms, for which its sisters may well envy it." As well might the active rifleman of to-day, in his tight-fitting easy dress, and with his handy but deadly weapon, envy the warrior of old, staggering along under half a ton of steel armour, and with no better tools than sword and spear! As well might the modern traveller, carried at the rate of thirty miles an hour in a comfortable railway earriage, envy the ancient German plunging through the muddy forest-roads in his vast and unwieldy bullock-waggon! Nature never works backwards, but ever onwards. The granite peaks of the Himalaya are worn by rain into a thousand wrinkles, and their substance is carried by countless rivers down to the plains of India; should we call the fertile soil of the Gangetic delta the "degenerate descendant" of those ice-bound peaks? Had the languages of India, and its soil, remained to the present day frozen hard in the bonds of a rigid synthetical system, or imbedded in the granite of its hills, they would not now suffice for the daily needs of its active and versatile millions. There is no language on earth so widely spoken as English, nor is there any tongue that has so freely and fully shaken off all inflections, genders, cases, tenses, and the rest: yet who shall dare to say that the language of Shakespeare and Milton is wanting in poetry; that of Bacon, Locke, and Hamilton in precision and clearness; that of Burke and Macaulay in power or eloquence? If the words of Sanskrit have in the present day lost many of their consonants and vowels, it is because they had too many to start with; ath is a handier word than ashtau, and no one would care to waste his time in saying abhyantare who could express his meaning just as well by bhitar. Let us not be misled by unphilosophical talk. The modern languages are not corruptions of the Sanskrit; they are improvements on it: and those that retain the greatest amount of its antique and elaborate forms are the least advanced of the group.

In none of the seven languages are the case-endings of Sanskrit preserved. The only trace of an inflectional or synthetical system is to be found in certain changes effected in the last syllable of some nouns, to prepare them for taking the detached particles which express the relations of case. Strictly speaking, a noun has in none of the seven languages more than four forms: the nominatives singular and plural, and the modified stem or oblique, or crude, or formative, for both numbers. Of the various names suggested for this latter case, I shall use the commonest, or oblique. The crude form of the noun is a term which I shall use when speaking of the oblique employed without particles, to signify vaguely all cases except the nominative. Of course the languages differ very much in this respect, as in all others. Oriya and Bengali have only one form for both nominative and oblique in both numbers. Hindi has an oblique form only in one class of nouns, while the rest indulge in a great many variations, whereby they gain nothing in clearness, while they lose much in simplicity and practical usefulness.

§ 39. To begin with the simplest of the group, Oriya and Bengali. Oriya has one form for all possible conditions of its noun. The case-particles, though not detached, do not affect the form of the stem. Thus, in a noun ending in mute short a, which is as much as to say, ending in a consonant, we have the declension—

Sing. N. ghar, "house,"

Ac. ghar-ku,

G. ghar-ar,

L. ghar-e, for
ghar-re,

for kur-re,

for kur-re,

In nouns ending with a vowel the result is the same. Thus,

rājā, "king," gen. rājā-r, " of a king," where the initial vowel of the particle has been sacrificed, but the stem remains untouched. So in the loc. rājā-re. The genitive, however, is the only case whose particle begins with a vowel, and consequently the only case in which any hitch can arise. Further instances are—

pati, "lord," gen. pati-r.
bahu, "wife," "bahu-r.
swâmi, "master," "swâmi-r.
nuți, "actress," "nuti-r.
bhû, "sarth," "bhû-r.

Some pedants profess to teach that words of the type sixtication (satisfies) shorten the i in the oblique cases, but this is a more attempt at aping Sanskrit. The popular speech takes no heed of such refinements.

Bengali is similar to Oriya in its treatment of the stem, which it subjects to no preparatory change when used with case-affixes, though, as these affixes are different from those in use in Oriya, it is necessary to give examples. Thus, in nouns ending in a consonant, we have the following cases in which collision might occur, owing to the particles beginning with a vowel:

Sing. N. kukkur, "dog." Pl. kukkur-erd.

G. kukkur-er, kukkur-er diger.

L. kukkur-e, or kukkur-ete.

In the plural, however, it is more usual to add a word denoting plurality, as will be shown hereafter, to which the caseparticles are affixed. The form of the plural in -erd is generally restricted to words descriptive of human beings, as cantanerd, "sons."

Words which end in vowels retain the form of the nominative stem throughout, and avoid collision by cliding the initial vowel of the particle, just as in Oriya, though—owing to the very unsettled character of the language, which has not yet made up its mind which of its varying forms it will regard as the classical, or generally to be adopted—some difference of practice is observable among good speakers and writers. I follow the guidance of Shamacharan Sirkar, who, however, like most learned Bengalis, leans rather too decidedly to the Sanskrit and high-flown side of his language, though he is practical enough to notice most of the peculiarities of the spoken language. Thus—

Sing. Nom. ghorå, "horse,"

G. ghorå-r.

L. ghorå-s.

= ghorå-y.

Further examples are-

nări, "woman," G. nări-r, N. Pl. nări-rd.
paśu, "beast," G. paśu-r, L. paśu-te.
jau, "lac," G. jau-r.

Very frequently the plural signs are entirely omitted, and the fact of plurality left to be inferred from the context. In Old Bengali, instead of eliding the initial vowel of the ease-particle, collision is avoided by inserting \(\mathbf{q}\). This letter is not pronounced, but acts as a fulcrum merely. Thus the G. of "lac," would be written \(\mathbf{q}\) are or in its own characters (\(\mathbf{q}\)), the dot under the \(\mathbf{q}\) indicating that it is to be softly pronounced, and not, as usual, like \(j\). For instance, in Kabi Kankan's Chandi, where the merchant's wife Khullana is subjected to the ordeal of being burnt in a house built of lac and other inflammable substances, Vishwakarman builds for the purpose—

জৌরের আড়া জৌরের পাড়ি জৌরের কপাট jan'er ara, jan'er pari, jan'er kapat-Beams of lac, rafters of lac, doors of lac. § 40. Hindi, with which in all important respects agrees Panjabi, comes next in respect of simplicity. All nouns ending in a consonant remain unchanged throughout. The only class in which any change takes place is that of nouns in d, when derived from Skr. nouns in -as, through the intermediate forms an and o. Nouns of this class form their oblique singular and nom. pl. in c. As Sing. N. \$21 "son," Obl. \$2. N. Pl. \$2. The oblique pl. is in Old-Hindi ani or an, in Modern-Hindi -on-Thus—

Sing. N. घोडा "horse." N. Pl. घोडे. Obl. घोडे. Obl. घोडें।

To this oblique form are added the case-particles, as धोई को
"to a horse," धोई। को "to horses." Exempted from this rule
are those nouns in d derived from Skr. nouns whose nom. is
already à; as एका "king," दाना "giver:" these do not
change in the singular oblique, or nom. pl.; thus they say
एका को "to a king," दाना "givers." The rule is carelessly
kept in old writers, and even in the present day among the
peasantry one may often hear धोदा को; moreover, the neglect
of the plural is very common, and it is colloquially more usual
to employ the singular, as बीस धोदा "twenty horses." Instances
of neglect of the rule in Old-Hindi poets are these—

## तिहि वरा आयी कहै। देरा माहि पनग ॥

"At that time came somehow Into the tent a snake."-Chand, L 246.

Where we should expect 37 H. A similar passage is

### राज जाए डेरा मधि॥

"The king came into his tent."-Chand, i. 194.

And in the Bhaktamålå occur कटोरा में "in the cup," लरिका के "of the boy" (Namdev.).

The feminine noun in f undergoes no change in the oblique singular; in the plural the inflection of plurality is appended to the simple unchanged stem, as चेटी को "to a daughter," चेटी की "to daughters." No other preparation of the stem occurs in Hindi, which is thus, except in the one instance of nouns in d, as simple as Bengali or Oriya. Panjabi retains unchanged all nouns ending in a consonant; those which end in a vowel are treated much as in Hindi. Thus—

So also in words which have anuswara over the final d; as

N. Sing. विशास '' trader.'' | N. Pl. विशास .'
Obl. विशास .'

Panjabi has no fear of the hiatus, any more than Hindi has, and even in nouns where the final à is preceded by a vowel, it makes no effort to prevent collision; one instance in point is the word last quoted, another is uvest "a trier," obl. uvest parakhaŭe, pl. n. the same, and pl. oblique uvest marakhaŭe, pl. n. the same, and pl. oblique uvest marakhaŭian! where no less than four vowels follow one another. It would not be inaccurate, however, though unusual, to write uvest i, thus avoiding the hiatus altogether. Still, a few words, ending in s and s, change that letter to s before the termination of the oblique plural; but even this is optional, and in a language so split up into dialects as Panjabi, no hard and fast rule can be laid down. fus "father," writes the oblique pl. usi s "to fathers;" and "crow," and s "to crows;" and "mother," and s "to mothers;" but fusual, and also heard in some districts.

There is nothing more to be said about these two languages at present.

§ 41. Gujarati is older in form than Hindi, and is in fact little
more than an archaic dialect of that language, brought by the
Châlukya Râjputs into the peninsula of Kâthiâwâd, and there iso-

lated and cut off from the other Hindi dialects, and thus gradually developed into a separate language, retaining antique forms which have dropped out of use in the parent speech. Its grammatical formations are consequently more complicated than those of Hindi, and in respect of the preparation of the stem it exhibits special peculiarities. Nouns ending in a consonant (i.e. mute a) in this language have more than one form, but the oblique form is not universally applied. In some cases the case-particles are affixed to the direct or nominative form, in others to the oblique; the accusative and dative (which are really only two different branches of one case, the objective) and the genitive affix their case-particles to the direct form; the instrumental, locative, and ablative use both the direct and oblique forms. Thus from \$\frac{3}{4}\$

Acc. and	D.		61.100	٠	देव ने
					देव नी
					देव ची-
					ld.
Loc		35			देव मां-

The oblique form is the same as the nom.; but there is also an oblique in e, as देव, of which more will be said in a subsequent section; this form alone is used as an instrumental and a locative; but both these cases ordinarily take case-particles to define their meaning more sharply; in which case we sometimes find the direct, and sometimes the oblique stem used; thus, abl. देव भी and देव भी, instr. देव करीने, id. It will be pointed out in its proper place that Gujarati is fond of heaping up pleonastic case-particles, this is one instance: देव, already bearing the meaning "by a god," the form देव भी is pleonastic, but is utilized to express a slightly different shade of meaning. The result in Gujarati is a striking proof of the essential unity of all the languages in the group, the termination e running through them all in a singularly homogeneous way. It would be strictly

correct to say, that in nouns with a consonantal ending, Gujarati, like its parent Hindi, has no separate form for the oblique, the form in e, which has now crept into use, being, as will be shown presently, an old case-ending, or rather two separate case-endings confused together. The plural of nouns of this class is formed by e, as and "gods;" to this the ending in e is added, as and but only in the instrumental and locative.

Masculine nouns in o, corresponding to H. in d, from Skr.
a-stems, have three forms for the singular; the nominative in o,
the purely oblique in d, and the instrumental-locative in e,
thus—

- 1. Sing. Nom. दाहाडी "day."
- 2. Objective दाहाडा में.
- 3. Instr. and L. दाहाडे.

But the instrumental and ablative append their case-endings to both 2 and 3, as दाहाडा थी and दाहाड थी. The genitive uses only 2, as दाहाडा नी; and the locative, when it takes the case-ending, uses 2; when not, it uses 3: thus we have both दाहाडा मां and दाहाड for "in a day." Strangely, too, the instr. sometimes adds its e to form 2, and appears as ZINITO. The plural of this form is regularly d, as gigigi "days;" but this appears to have been felt too vague, and in modern times an o has been added, which brings the plural of this form into homogeneity with the plural of consonantal nouns; thus it is now spoken ZIZIZIWI, to which latter forms case-endings are affixed. Here, again, the instrumental adds its e to the fuller form, giving a string of vowels, as दाहाडाओए dahadaoe, "by days." Precisely similar in all but the nominative is the corresponding neuter noun in 3; thus, मोहोदे "a face," pl. Higher, where the anuswara alone differentiates it from the mase.; the modern form with o, however, drops the annawars, and is thus identical with the mase,, as in Higherth. Nouns

ending in all other vowels, including o, when it is not derived from Skr. bases in -as, add the es and os to the final vowel, without making any phonetic combinations. Examples are:

```
N. Sing. pati, "lord,"
                      Instr. patie, N. Pl. patio,
                                                Instr. pation.
       nadi, "river."
                        .. madle.
                                     nadio.
                                                  .. nudloe.
       rantu, "thing,"
                       n wastur,
                                    u vastno,
                                                 vastuoe.
      vahil, " wife,"
                       w wahile,
                                     " vakilo,
      chho, "mortar," .. chhoe,
                                   .. chhoō,
                                                   chhoöe,
```

The spelling of Gujarati is still very unfixed, and the fulcrum u is often used, as in Bengali, where vowels come together, and has no effect on the pronunciation, ufau and ufau are written imdifferently.

Marathi, which comes next, is in every respect a complicated language, having been unable to work itself free from that maze of forms and terminations which an ancient synthetical language always leaves behind it. In the matter we are now discussing, its usual ill-luck follows it, and the student is irritated by the variety of the changes he encounters. In addition to special forms for the locative and instrumental, it has the regular four forms, the two nominatives and two obliques, and is, moreover, encumbered with three genders. The variations in the oblique, which is also the crude form, are divided by grammarians into six classes, a division which will be followed here, though it is not quite free from exception. There is some want of fixity in Marathi in this point, and authors are not quite at one as regards the forms to be used in some nouns.

 Masculine and neuter nouns ending in mute a, lengthen that vowel in the oblique form of the singular; masculines

No distinction is endingrily made in G. between long and short i er s. In fact, the ordinary current band has not distinct characters for the two sounds.

have the same form for pl. nom. as for sing., while neuters add t; the oblique plural in both cases is formed by wit. Thus we have—

MASSURLINE. अहणाहा. N. Sing. बाप "father," N. Pi. बाप. घर "house," घरें. Obl. बापा Obl. बापां. घरा घरां

Similar to this class is that of nouns in \(\mathbf{\cap}\) and \(\mathbf{\cap}\), which lengthen their respective vowels; all three genders are treated in the same way.

N. Sing. कवि "poet," N. Pl. कवि . N. Sing. मधु "honey," N. Pl. मधु . Obl. कवी . Obl. कवी . Obl. मधू . Obl. मधू

The three short vowels are so far perfectly homogeneous in their treatment.

(2). Feminines in short a, such as the words given in § 11, where the short a has arisen from shortening the long a of a Skr. fem., form their oblique sing, in e, their pl. nom, in d, and pl. oblique in and ; and words of the same class, which have retained their original long a, are formed in the same way. Thus all "tongue," and HIST "mother," differ only in the nominative singular.

N.Sing. जीस "tongue," N.Pl. जीसा. | N.Sing. साता, N.Pl. साता. Obl. जीसे, Obl. जीसा. | Obl. सात, Obl. साता.

(3). These same feminines in short a, however, exercise the feminine privilege of not knowing their own minds; for while some take s in the oblique, others take s, and a large number vacillate between the two.

> N. Sing. आग "lice," N. Pl. आगी. Obl. आगी.

फांक "a slice," has फांकीना and फांकेना "to a slice;" चीड "offence," चीडेना and चीडीना (4). Long vowels follow the same general principle as the short ones; their vowel being already long, no further change takes place in the oblique singular. The formation of the plural is multiform, and will be discussed in a separate section; the oblique plural, like that of class I, only differs from the singular by the addition of anuswara in nouns ending in a: in other cases anuswara is added to the form of the nom. plural, which is a recrudescence of the vowel of the singular into its semivowel, effected by the addition of a.

This may be considered the typical method of treating nouns ending in a long vowel, but there are yet two other processes.

(5). A few words ending in ₹ and ₹ mase, and neut., and all diminutives in ₹ and ₹, have a way of their own. They reject the labial vowel, and form the oblique sing, in â, pl. ân. Masculines have the same form for both nominatives, neuters having the invariable neuter pl. in ₹.

(6). Lastly, as if purposely to complicate their language, the Marathas have a totally different method of treating nouns of all three genders ending in long vowels, as well as those neuters which end in an anaswara. The process here adopted is the hardening of the final vowel into its semivowel—W in this case having no semivowel of its own, takes U—and affixing to the secondary stem so formed the masculine oblique termination a for mase, and neuter nouns, and the fem. e for fem. nouns. This class, however, is not well fixed, for many masculine words in it may optionally form their oblique as in class 4, and the feminines as in classes 2 and 3. Thus विष् "a scorpion," m., may in the dative form be विष्णा or विषयां। The fem. साम may either make as above सामुखा, or under this rule सामवा. There are even some words which are spoken in three ways: thus चातृ "grandson," m., चातृजा, चातांचा, and चातवांचा. अंग्रं स. "tear," संमुखा, संस्थाना, संस्थाना, सामवाना.

Types of this class are the following:

र्वाः
या
चां-
ai-
t-
-

Exceptional is स्त्री "woman," making Obl. स्त्रिय; N. Pl. स्त्रिया. Obl. स्त्रिया. The above are all the forms in use in Marathi, and in this last class it must be noted that polysyllabic nouns in द्व do not join the varising therefrom to the preceding consonant, but keep a short a between; thus, ताइ "ship," तारवादा. not ताडादा; also that monosyllables in ú, not only change that vowel to द, but still retain the vowel, though shortened, as मू "needle," मुपाना.

We now pass on to Sindhi, in which language we have the good fortune of being able to avail ourselves of the inestimable labours of that sound scholar, Dr. Trumpp, whose grammar of Sindhi is the only grammar of any of our seven languages which has as yet been written on correct philological principles. In the following abstract I work entirely from Dr. Trumpp's materials, though I have altered his arrangement slightly in order to bring it into harmony with that followed in respect of the other languages. Sindhi has, like Gujarati, the locative in c, as \$\frac{1}{2}\$ "in a country" (Skr. \$\frac{1}{2}\$). It has, besides, the usual four forms, to wit, the two nominatives and two obliques, as in Marathi.

(1). The consonantal ending or mute a of the other languages is represented in Sindhi by a for the mase., and a or i for the fem. Nouns in a have the following scheme of forms:

Where the final u is preceded by u, the semivowel is inserted to prevent histus; it is also inserted after wi, and optionally after other vowels, except i or i.

Nouns which end in short u, derived from other sources than the Skr. a-stem, remain unaltered in the oblique singular, and in the oblique plural either follow the nom. plur, or sing. The words of this class are chiefly, if not entirely, the old words of relationship, which in the formation of the plural follow the Prakrit system.

M. REXIL	000	N. Ph.	om.
fus "hither,"	पिछ.	पिडर.	पिवनि वर पिवर्निः
साउ"brother,"	भाउ-	भावरः	भाउनि ल भाउर्गिः
मेगु "sister,"	भेगु-	मेणूं क भेगक्,	the state of the s

In the feminines in a the vowel is shortened in the oblique plural, as—

(2). Nouns in short a, which is always fem., do not change for the oblique sing.; their oblique pl. is given below.

ह. साम ont. हा. ont. काम "beam," काम, जार्मू क कामां, कामें or कामुनि सध "wish," सध, सधूं or सधां, संघे or सधुनि

And the same holds good of nouns in short i, both mase, and fem., the only peculiarity being that mase, nouns use the older and longer form in the exclusively, as aget "lion," obl. pl. aget.

(3) The termination o, corresponding to the a of Hindi and the other languages, modulates into a for the oblique singular, and dn, én, or ni for the plural; thus—

N.S. सथी "head," Obl. मथे, N. Pl. सथा, Obl. सथा, मेथे, सथनि

When this final o is preceded by a or a, it inserts v, to prevent hiatus, but not when preceded by other vowels.

- (4). The other long vowels may be grouped together, as below:
- भा N. Sing. आस्या, Ohl. आस्या, N. Pl. आस्याजी, Ohl आस्याजीन.

When the anuswara precedes the final vowel, it is retained in the oblique forms also.

§ 42. The following table exhibits the whole of the typical terminations of the nominal stem in all the languages except Bengali and Oriya; these two languages having no change of the stem need not be included:

STEM	FORM.	HINDI.	PANTABL	GUJARATI.	MARATHI,	SINDHI,
		MANU. FEM.	MAKE, TER,		MANG PRE, NEUT,	MARE: TEM.
	Nom. Sing.	į,	Ţ	į	1 1 1	B
- Tributa	Oblique ,,	1	1	ı	1 0 t'	
M mute,	Nom. Pl	+	1	F	1	7
	Oblique Pt.	朝 朝	ŧ	伊	i air	मि प्
	N. Sing.	1	he	w	ŭ	j.
1	O. Sing.	v	w	سو	+	r he
	N. Ph	~		E	T M. F. N.	
	O.PL	E	(at	色	(a)	U. Eff
	N. Sing.	io.	lo	D	to	8
D	O. Sing	р	p	D)	16	. 1
	N. Pl	p.	bo	वसी	B M. F. N.	* #
	0.PL	वर्षीं	जमा ।	Bait	#	5 4

	N. Slag.	F		all all		乍	TP	F	- N	p li	Þ	4	þ
	O. Sing.	p/		Þ	Т	F	F	F	듉	THE D	F	Þ	Þ
	N.Pl	p	WILE	Þ	100	बाक्रो	माको यांची	þ	Þ	F	de	is in	WITE
	O. Pl	4		E.		भाषो	बाजी यांची	¥	古	¥	Þ	या. ए. यनि	षावि
	N. Sing.	de		ila				-	de	abor	de	de	der
=	O. Sing	de		del				shot	듑	4年	qT	E	E
	N. Pl	die	Ē	444	E				die	ם	ild Toly	ile/	र्ष, रक्त. य
	O.Pl	Ē		E				the	덕	급.	व	Test ate.	Cutt. etc.
	N. Sing.	15		15				11.00	16	15	市	jō.	
	O. Sing.	16		iō		ti		15	भा वा	10	F	20.00	
	N. Pl	15	Sault	15	क्रमा				165	F	jar.	15	
	0.FL.	सम्ब		कथा				·m	बार वर्ग	To	T T	Saff, etc.	170

From this table, which is designed to show merely the leading and typical terminations of each language, are purposely left out all rare or exceptional forms, such as the small handful of words ending in o, not derived from a-stems, a few in e and of, and the like.

§ 43. Before entering upon the attempt to explain and account for the manifold variations of the oblique form of the noun, it is necessary first to exhibit the system of forming the plural. The terminations of the nominative of the plural have been given along with those of the oblique in the foregoing sections, but nothing has been said in explanation of them.

In respect of the plural this group of languages may be divided into two classes: first, those which form their plural always in one unchanging way; and, secondly, those which have more than one way of forming it. In the latter class stand Marathi and Sindhi, in the former all the rest.

Of the former, or uniform languages, the simplest are, as usual, Oriya and Bengali. Oriya formerly made its plural by adding e, as kumdr, "boy," pl. kumdre. This plural is still found in poetry. Thus Dinkrishna (x.n. 1520) writes of Krishna and Balarama—

# कुचा कुचा ने कुमरि रोदंति। कळकंठ कंठ हेळे निदंति।

"When the children weep with wailing cry, They easily surpass the song of the Kokila,"

-Passkollole, iii. 110.

And again-

# कर्ण देइ ग्रुन साधु वर्ने ॥ कुमारंक वनमित्रे केते दिने॥

"Giving ear, listen, O virtuous men!
Some days after the children were born."—id. iv. 1.

-where kumdre, jane, and dine are the nominatives plural of kumar, jan, and din respectively. This form, however, was probably found too indistinct, and was liable to be confounded with the instrumental and locative singular. A noun of multitude was therefore adopted; and the word selected was सान "measure," a word already in use in isolated expressions, such ns दिनसान "daily," in other languages. A distinction is made in the use of this word between animate and manimate objects; thus they say बजद "ox," pl. बजदमाने: पहिसा "neighbour," pl. पहिसामाने; but जाल "net," pl. जालमान; भार "a load," pl. HIXAIA. The e indicative of the plural is here retained, but tacked on to the plural sign mas, only in the case of living beings; it is omitted in the case of inanimate objects. The cass-particles are affixed to a form #14; thus the genitive sign is मानंबर, now-a-days often, but erroneously, written मानक्र. The Oriya language is absolutely and undeviatingly regular in its way of forming the plural, the method above described is the only one in use, and the language does not contain a single exception.

Bengali has more than one way of expressing the plural, but I reckon it among the uniform languages because of the methods in use, only one is a true plural; the others are periphrases or compounds of two words, and not, strictly speaking, plurals at all. The regular form of the Bengali plural is ut erd; the initial letter of which is elided when it follows a noun ending in a vowel. It is not unfrequently clided, even when attached to nouns ending in mute a. This form of the plural is now in practice restricted to rational beings, and even in their case the periphrastic plural has gradually come to be used. Ex-

amples of the true plural are-

पुत्रव "man," Pl. पुत्रवेरा or पुत्रवरा-वालक "boy," , वालकेरा or वालकरा-राजा "king," , राजारा-नारी "woman," , नारीरा-

Sometimes a form simply in e, as in Oriya, is used for the

plural, as जोने "people." This is the genuine old plural, of which end is the modern representative. The periphrastic pluris formed by adding to the singular some word indicative of multitude. The words so employed are the following: गण "multitude," वर्ग "class," सकल, समल, सन, "all," समृद्ध "whole," गृज, गुल, गुल, गृज, वर्ग, "mumber." Of these गण, वर्ग, and perhaps समृद्द, are more commonly used with rational beings, the others with irrational or inanimate things, and गृज is familiar. Thus they would say, घोटा सकल "horses," केल गृज "children, brats," When these words are used to form the plural, they take the case-particles and endings, leaving the noun quite uninflected, thus—

N. Sing. जुकुर "dog." N. Pl. कुकुर समूह "dogs."

G. - जुकुर समूहते "dogs."

Obj. - जुकुर समूहते "dogs." "to dogs."

Instr. कुकुर समूह द्वारा "by dogs."

Abl. - कुकुर समूह होइते "from dogs," etc.

And even in words which use the true, and not the periphrastic plural, all cases but the nominative preserve the noun itself from change by inserting **[24** "side;" thus—

N. Sing. देवता "god," N. Pl. देवतारा "gods." 6. देवतादिगेर, or shortened ॰देर "of gods." Old. देवतादिगके "to gods," etc.

dered, "Hari and Muchi, this two caste almost of all other caste the food cats." An interesting example of this peculiarity may be adduced from Bharat Chandra's well-known poem, the "Bidyå Sundar," where he is describing the strange nations collected in the fort of Bardwan (a.p. 1740).

প্রথম গচেতে কালাপোধের নিবাস ৷
ই জরাজ ওলকাজ কিরিজী করাস ৷৷
জিনেমার এলেমান করে গোলকাজী ৷
সক্ষরিয়া মানা তব্য আনয়ে জাহালী ৷

"In the first fort is the dwelling of the black-coat Ingraj, Olandaj, Firingi, Faras, Dinemar, Eleman, practises artillery, Wanderer various goods brings in ship."

The whole of these nouns are, of course, in meaning plural, but in form singular, agreeing with the singular verbs kare and anaye. The passage, like all genuine Bengali, has a large sprinkling of Persian words, as جبازی صفری گول اندازی.

Hindi forms its plural very simply, with its usual practical common sense. Nouns with consonantal ending have the nomple and sing, alike, as wines "boy," nom, pl. wine "boya." The oblique plural is in Old-Hindi formed by win, which modulates into we and we. In the modern language this becomes wi. Feminines ending in a consonant form the nomple in w. as tra "night," nom, pl. tra. Nouns ending in a mase, from the Skr. a-stem, make their plural in w, and the corresponding fem. in a becomes the Thus—

सहका "boy," N.PL सहके. Obl. सहकों सहकी "girl." " सहकोओं. " सहकोओं

t These extions are ounselves and our European neighbours, who were known than, as now, to the Bengalis by their French names, the French being in these days the most important of the foreign settlers. Thus, Ingril is "Anglais," or English; Olandais, "Hollandais," Dutch; Firingi are the Portuguese, and Faris, "Français;" Dinomir is a corruption of Denmark, and Elemin are "Allemanis," or Germans.

In Old-Hindi the nom. pl. fem. was \$\footnote{\chi}\$, as \$\footnote{\mathbb{q}} \text{\*\*} book," nom. pl. \$\footnote{\mathbb{q}} \text{\*\*}\$; this form is still preserved in the participle. These few forms are all that Hindi finds necessary to express ideas, while Marathi and Sindhi have not had the skill to reduce their working apparatus into one or two plain homogeneous classes.

Panjabi is also quite uniform and simple in its plural. Nouns ending in à form the nom, pl. in e, all others have the two nominatives identical. An exception is made by a small class typified by \*\*\*\* "mother," which forms its plural \*\*\*\* though \*\*\*\* would not be wrong for the plural.

Gujarati is extremely uniform, simply adding o to the singular of all nouns of every description. In nouns ending in o, from the Sanskr. a-stem, this o becomes in the plural nom. a, and this was originally the only plural termination for nouns of this stem. But o having become the general type of the plural for all other stems, the popular feeling could not rest content with an anomaly: the plurals in a were not felt to be true plurals so lang as they lacked the universal plural sign o, and this was accordingly tacked on; so that we now hear stati "boy," pl. statis: and neuters of this class, which formerly made their plural in st. now also take an additional st, as to "egg," nom. pl. stist.

§ 44. Marathi plurals are multiform, but need not be given here, as they have already been shown in the last section. The plurals of Sindhi, however, which are also multiform, require to be drawn out more in detail. Trumpp exhibits seven classes, which are here given.

There are a few exceptions, or rather words which preserve a Prakritic method of forming their plural, and these will be noticed in the next section.

§ 45. Having now given the facts as regards the plural and oblique forms, we may attempt to trace their origin, and the steps by which they arrived at their present condition. In doing this we naturally look to the Prakrits, rather than to Sanskrit, because these modern languages are in reality developments of the Prakrits, or common colloquial speech of ancient India; and although in the matter of phonesis they have been subjected to influences alien to those which prevailed over the Prakrits, yet in the present instances they are almost strictly Prakritie. In fact, these modifications of the stem, to fit it to assume case-particles, are nothing more than relies of the old case-endings of the early Aryan speech, which have been so reduced by use, that what remains of them no longer suffices to indicate the case-relations clearly, and particles have to be called in for the purpose.

A remarkable family likeness runs through all the plurals

of the uniform languages, and extends to a certain extent into the multiform languages. The difference between the two classes is this, that while the former have selected for use one or two Prakrit forms only, and have applied them to all kinds of stems indifferently, the latter have taken the separate Prakrit form for each stem. In this respect these latter are decidedly behind their comrades, and it may be suspected, and indeed partially proved, that Hindi and Gujarati have centuries ago passed through the stage in which Marathi and Sindhi still remain; though, from the off-lamented absence of literary monuments prior to Chand (a.n. 1200), we are unable to trace the steps more than by few and faint indications.

The most widely used form of Sanskrit noan is the a-stem ; this forms in the nom, plural mase, and fem. ah, neut. ani. The dh of the mass, and fem. is in many of the Prakrit dialects changed into e; this change rests upon the tendency to break down 4 into e, already discussed in Vol. I. p. 137. In those Prakrit dialects which received most literary cultivation, the Maharashtri and Magadhi, the pl. masc. ends in d; this ending has been preserved by G, and S, as the plural of masculine nouns in o; as G. आजो, nom. pl. आजा (modern आजाको), S. id. The ending in c has been adopted by H. P., and, in some cases, by M. also; as H. P. azi, nom. pl. a2. In the case of masculines in d, Marathi has both forms, that in d and that in c. Of these two, however, the latter is the regular form, and the former is only found in a few peculiar terms of respect and the like, as arar "father," nom. pl. arar, where we cannot ascribe the word to a Sanskrit a-stem, but must regard it rather as an onomatopoetic or fanciful formation. The retention of the & in the nom. pl. of B. and O. is not attributable to the Skr., but is simply due to the general tendency of those languages to reject all sign of plurality in favour of the periphrastic construction with गण, or मान, already described.

The special Bengali plural in era divides itself into two parts:

the first of which, e, is the old plural form of nouns ending in mute a; and the second, rd, by the fact of its being confined to living beings which possess a distinct individuality, as contrasted with inanimate objects, connects itself with the reduplicated plural of personal pronouns, as amard "we," tomard "ye." The origin of this form will be searched out in the Chapter on Pronouns. It is sufficient in this place to note that this ending, by origin a pronominal one, has passed over to a certain class of nouns, and that it is in this latter usage of modern date, not being found in the oldest literary documents of the language. So modern is it, that in the form erd we have really a double plural, the old ending in a having lost its sense of plurality in the popular mind before the rd was added.

The general preference of the lower kinds of Prakrit, and after them of several of the modern languages, for the form of the mase. pl. in e, rests, in my opinion, on the fact that even in Skr. this is the regular form for the class of pronominal adjectives, as ##; "all," nom. pl. ##. It is admitted that this method of declension represents an older and more genuine form of the e-stem; and it is in keeping with the general peculiarities of these languages to suppose that they derived their forms from the ancient Aryan language, and left on one side the modifications introduced into classical Sanskrit.

Next comes the neuter plural, which is of special importance, because it has usurped in many cases the functions of all other plurals. In Skr. it ends in ani, as un "wealth," nom. plurals. In Prakrit this form becomes as or ain, as unit or unit; "usus addit masalem," says Lassen, p. 307, but it seems more likely that the masal is a relic of the n of the Skr. with, and it would be more correct to regard the form with as the older of the two, and to say of the other form "usus omitti masalem." As early as the seemic Prakrit this form has passed over to the masculine, and we find zerit as pl. of the mass. Zerit. In Old-Hindi, the universal form of the pl. for all genders pre-

serves the Sanskrit form better than Prakrit does, by writing चनि: us नरनि "men," बन्तनि "words." At a later stage the final ( is rejected, and the form becomes we, as बालकर "boys." The language, however, does not feel the need of any sign to distinguish the nom. pl. from the sing.; and this termination, which, as will be pointed out later on, has become fused into one with that of the genitive in will, has remained in use only in the oblique cases, to which the Middle-Hindi adds an T. making the termination wee. Thus in Tulsi Das we have (A.D. 1650) regularly such plural forms as wellers "wrestling-places," एक्ट "some," चरनन्द्र "feet." The Middle-Hindi poets use all three forms side by side; thus in the same page one sees HARF "devotees," united "youths," and uta" houses." Only in the fem, of words with a consonantal ending is the Prakrit form in use. Thus from with annawara we get the Old-Hindi form in ain, as vid "nights," from which comes the modern form vid. The masculines of this form do not change in the plural, and the retention of this ending for the fem. is probably due to a desire to mark the difference of gender. Although the ending wit is, as we have seen, neuter, yet Hindi has lost the neuter; and this ending had even in Prakrit got loose from the neuter, and was used for all genders, so that its application to the fem. in Hindi is not surprising. Marathi is more exact in using o, which is contracted from wit, as a neuter, thus preserving the original gender. This of is used for the nom, pl, of neuters of the consonantal noun, as well as those which end in ? and 3. which harden the final vowel of the stem into the corresponding semivowel before this termination, as with "pearl." pl. wid: तांक "ship," pl. तांबे or तार्बे. In the case of neuters of the d-stem, which already in the singular end in \$\vec{v}\$, the plural does not shorten the Pr. Wt into v. but, rejecting the first vowel. makes the v long, and writes v, as 25 "plantain," pl. 3551. The same process takes place in Panjabi after feminines in long d, as बना "calamity," pl. बनाई or बनाई थां.

Gujarati has adopted one, and that the most common, of the Prakrit plural forms for other than a-stems, and simply adds It to all stems without exception, even to the class ending in a, which already had made its plural in d, so that it now becomes do, as noted above.

In the same way as it retains t as the termination of feminines which end in a consonant, so Hindi uses the Pr. form with in another way after feminines in long t and a. Thus बंटी "daughter," pl. बंटीकां; जोड़ "wife," pl. जोड़कां, where the final i has been dropped, and the anuswara carried back to the d. The same takes place in Panjabi, as will "daughter," nom, pl. with, and is extended also to feminines of the consonantal ending, as मझ "a word," nom. pl. मज़ा. Chand uses this form also with masculines and neuters, with \( \mathbf{q} \) or \( \mathbf{q} \) inserted to prevent hiatus, and, with his customary disregard of quantity, often makes the a short: thus we see मुख्य for मुख्यां " spiritual guides," Ngai "pots." To be connected with this is, I suspect, his not uncommon practice of adding आन, as उरान "breasts," मुद्दान "garus," आतान "observances;" but the passages in which these forms occur are so obscure, that it is difficult to prenomes a decided opinion. It is clearly a plural, however, in the following:

#### सहपाप रत द्रवान चंध।

"Addicted to great sin, blinded by riches."-i, 137.

There remains to be deciphered the mystery of the multiform plurals in M. and S. In the former the consonantally ending noun, if mase, undergoes no change; when fem, however, it has two methods, it either makes d or t. This arises from the fact, that fem nouns of this type are shortened either from femnouns in d or t in Skr. Thus also "tongue," from Skr. fagt. pl. fagt:, makes its pl. accordingly also; but any "tire," from Skr. afty, Prakrit afta, pl. aratha, simply rejects the final o of Pr., and takes for its plural with. In declining

words of this type in M., it is therefore always necessary to go back to the original, either in Skr. or Pr., in order to ascertain which vowel has been rejected, and thus to know how to form the plural,-a difficult process, which the more advanced languages avoid by simply having one termination for all classes. Even to the natives of the province who have spoken this crabbed language all their lives, this practice causes difficulties; for the grammarians give a long list of words which may be formed in both ways, though, from not knowing the real reason of the co-existence of the two forms, they are unable to pronounce which of the two is correct. Nouns in short T and 3 of all three genders make no change in the plural, being rare in the vulgar speech, and consequently not the subject of any regular development from Prakrit, Masculines, except those in 4, do not change in the plural. This is a practice which seems to run through all the languages to a greater or less degree, as has been remarked under Hindi; and all neuters of whatever class have a tendency towards to or its prolonged form \$. Finally, feminines in \$ and \$ form their plurals in या and वा respectively, in which we may see the Prakrit plural ending wi changed into a, as in Hindi singulars. Prakrit, however, does not dislike the hiatus; it makes plurals देवीची. बहुचो, from singulars देवी, बहु, where Marathi hardens the stem-vowel into its semivowel, and uses देखा, बहुवा.

Sindhi is quite as multiform, though less irregular than Marathi. The masc, in w, corresponding to the consonantally terminated noun of the other languages, forms its nom, pl. in a, shortened from the Prakrit pl. of nouns in o whose plural ends in a, as qual, pl. qual. Trumpp (p. 105) points out very justly, that as the singular ending in u is shortened from Pr. o, it is consistent that the plural form should be shortened also; though I cannot agree with him in thinking that the Hindi and P. have done the same, as Old-H. makes the nom, pl. of this class in uni, which has been subsequently rejected, and which,

BE WE have already shown, is derived from the Skr. neut, pl. in wife. The feminines of this class ending in a and i have separate forms; those in a, being shortened from Skr. feminines in d, like the corresponding class in Marathi, take either day or day. The former of these is to be accounted for, in my opinion, in the same way as Panjabi feminines of the type we, pl. next, by the passing over of the Prakrit neuter ending wife into the fem., and not, as Trumpp suggests, by rejecting the o of the Pr. pl. form with, because this process would not account for the anuswara. It is true that M. forms like with, with, have rejected the o of Pr. animal, within; but then they have not taken the anaswara, which S. has. I therefore think it more correct to connect Sindhi in this particular with its neighbour Panjabi, than with distant Marathi.

The other form of the pl. in si is common to all fem. nouns in the language. No satisfactory reason for this form has been shown. Even if we admit that the o of Pr. plurals has been changed to û, this does not account for the anuswâra, which is too important a feature to have crept in by accident. It may have been extended to the nominative from the oblique cases of the Apahhransa pl. (see Lassen, p. 464), as is often the case in other languages. The remaining musculine nouns do not change in the plural.

§ 46. Our next business is with the oblique forms, and this is perhaps the most intricate and difficult part of the inquiry. The oblique forms are, like the nominatives plural, remains of the synthetical declension of the Prakrits, and the mystery is not so much what they are, as how they came to assume their present shapes.

We must start from a fact, patent enough in the Romance languages, but not quite so patent in their Indian congeners, though even in them it can be established by illustrations as well as assumed from analogy. It is this, that at an early period the distinctive case-endings of the synthetic system became confused, and one was often used for another. Some examples of this practice in medieval Latin were given at p. 113 of Vol. I. Now in the Prakrits the first step was the total loss of the dative, and the substitution for it of the genitive. The forms of the other cases also began to approach nearer to one another by degrees as they lost the distinctness of Sanskrit, so that in time much confusion crept in, and the terminations, which had been originally very different, all merged eventually into one form, which constitutes the oblique of the modern noun. The languages show their consciousness of the fact that the oblique form is a relic of the various cases (other than the nominative) of the old inflectional noun, by adding the particles which they now employ to indicate cases to this oblique form, and not to the nominative or direct form.

It is not, in my opinion, correct to derive the oblique from any special case of the Prakrit; it rather results from a general fusion of all the cases. I am here speaking of the singular only; the plural oblique, though analogous to the singular, must be traced separately. Taking first the ordinary Sanskrit a-stem, which comprises a very large majority of the nouns in the language, it appears that, after the rejection of the dative, the Maharashtri, or principal Prakrit dialect, retained only the following scheme of case-endings. N. o. Acc. am, Instr. ena, Ab. ado, adu, G. assa, L. c. But the distinction between the N. and Acc. was early lost, and there remained, even in this the most Sanskritic of the Prakrits, only four forms, ena, ado, assa, and c, for the oblique cases of the noun.

Maharashtri is to a great extent confined to poetry. When it is used in prose, it loses some of its distinctive features, and assimilates to the Sauraseni, the principal prose dialect. In this latter the ablative is found to end in d, and dhi, and in the Magadhi, the genitive has also begun to draw towards this type, exhibiting the termination dh. In the dialect of the Saptašataka the ablative terminates in \$\text{ado}\$, but has also the forms \$\tilde{a}\$, \$\tilde{a}o\$, \$\tilde{a}u\$, and \$\tilde{a}hi\$. The Bhagavati has a very similar range of case-endings.

It is, however, especially to the Apabhransa dialect that we must look with regard to the modern languages, as this dialect seems in most respects to be the truest representative of an actually spoken dialect. Here we find a still greater fusion of case-endings, abl. ddn, dhe; gen, dhe, dho; loc. e, i, dhin.

Here we must stop as regards Prakrit, for at this point we reach the gap of many centuries which has not yet been bridged over. When we come to the beginning of the modern period, all case-endings have been lost in most of the languages. The work of fusion went on during that obscure period, and we have no means of discovering how it proceeded.

It is next specially to be noticed that Old-Hindi possesses a singular crude form ending in fg, which is applied without distinction to all cases of the singular. This form takes us back to at least three cases of the Apabhranéa, namely, the ablative, genitive, and locative, and virtually includes four, as the dative was already fused into the genitive. The universality of application of this termination in fg will be seen more clearly when we come to the Pronoun, which in all languages retains archaic forms with peculiar tenacity. But also in the noun its use is very frequent; thus Chand employs it as a dative, or sign of "direction towards," in

## किहि काज रिषि आयों घरहि।

"For what cause, Rishi, hust thou come to the house?" -Pr. B. v. 48.

And as an ablative in

### को जिहि वंसहि ऊपन्धी।

"Who (am I) from what race sprung."-ib, L 167.

Tulsi Das has numerous examples, as सीताहि देखि वहीं "Having seen Sita speak (to her);" इनकी कथा संदेपीह कहीं "tells the story of them in brief" (संचेप); आदिहि ते सब कवा सुनाई "having told all that tale from the beginning."

Now it will be observed that in the general fusion of forms the only two types that remain are the instrumental in east, which is not changed as far as the data for classical Prakrit go, and the ablative-genitive-locative-dative in āhi; but by the simple process of the clision of the ₹, we get āi, which naturally slides into ε. The transition is well shown in the scraps of the later Apabhransa dialect preserved in old Gujarati, thus—

## षड़ोतर सु बुढडी रावणतगर कपानि॥ एकू बुढिन सांपडी लेका भेत्रण काली

"A hundred and eight (kinds of) knowledge were in the head of Ravan, Not one knowledge profited him at the time of the destruction of Lanks." 1

Here ( ) and grees with the governing noun in number, gender, and case. Suffer (for Suffer) being in the locative, the termination of the adjectival genitive must be in the oblique form to agree with it, and any is therefore used, in which at shows as the shortened form from āhi. At a later stage of the language this is written and.

The instrumental retains its form of ess in Chand only in Gatha passages; but even in them, for the sake of his metre, he often rejects the na, leaving only the e, and this again he sometimes modulates into aya,

From the above considerations it results that the distinctive features of the case-endings in Sanskrit all, in course of time, melted down into one form distinguished by the ending áhi, ái, or e. We thus account for the fact that in Hindi and Panjabi

<sup>&</sup>lt;sup>2</sup> "Gojaráti bhásháno itihas," p. 44, quoted from a poem called Munjarias, the date of which is not given.

the oxytone noun in d forms its base in e, as ghord, ghore. The same takes place with Sindhi nouns in e, which correspond to Hindi oxytones in d, as HUI "head," HU. Hindi and Panjabi have only this one method of forming the oblique, and, as I have stated before, only employ it in oxytone nouns ending in d. All other nouns virtually end in a consonant, and are not therefore open to any change; they have rejected all inflection absolutely. In mediaval Hindi, words of this class use the form for with no connecting vowel, as THE "to Râm," and when, in process of time, this affix was dropped, there remained nothing but the bare stem, incapable of inflection. Even in those nouns which, strictly speaking, end in other vowels than d, the same rule is followed, because these languages take no heed of final vowels, and in speaking, at least, reject them always; and even in writing they are of little value.

It is in the languages of the western group-as might be expected-that the greatest diversity exists, and to them we must now turn. Sindhi takes for the general type of its singular oblique the vowel a, for which Trumpp hints at a derivation from the genitive; but we have pointed out that, before the period of the rise of the modern languages as such. the Apabhransa Prakrit had already nearly obliterated all distinction between the genitive and other oblique cases, bringing them all down to the common form ahi. If this be the case in the written Apabhransa,-which, though wandering far from the central type of Prakrit, must still, as a written language, be supposed to have retained greater regularity than the spoken language,—we are justified in supposing that, in the spoken, a still more complete fusion of all the case-endings must have taken place; and it is not likely that a rude pastoral race would carefully observe such minute distinctions as that between 4hi, Moreover, we notice that even in the ake, ako, and akin, written language, in one case at least, the final short vowel had been rejected, so that the ablative ends in 4A or d. Sindhi is

very prone to the shortening of vowels. Thus it would be quite in harmony with the general practice of the language, to preserve out of all these endings nothing more than short a. In masculine nouns ending in a, we have really the consonantal ending of barytones of the a-stem, and it is therefore only what we should expect to find that the oblique of this class should reject the u, which is hardly audible in pronunciation, and conelude with a. Thus दास "slave," obl. दास, may be traced back to a Prakrit form nom. दावी दास, obl. दासाहि, दासाहे. दासाहो. दासाहि, all of which in the spoken language would fuse into दासहि, as in Hindi, and thence into दासह, and finally दास. The reason why nouns in o form their oblique in e after the Hindi fashion, appears to confirm the view I have taken of the origin of these nouns. When they owe their long final vowel to the fact of their being derived from Skr. oxytones, the presence of the accent on the final syllable prevents the terminations dhi, dhe, etc., from shortening their & into a; all that takes place therefore is the rejection of \$\epsilon\$, and the termination thus becomes di, which by a natural process becomes c. Sindhi nouns in short a and i do not differ in their oblique from the nom. This is a further confirmation of the view expressed above. The Prukrit oblique of such nouns would end in thi, ali; but the i and a belong to the stem, not to the termination; and when the hi is rejected, there remains nothing, so that the oblique cannot undergo any change. Nouns in long I and 0 add an a to the stem, which is again a relie of the common form also deprived of its final hi. Long before the epoch of the formation of these modern cases, the Prakrit had disencumbered itself of the habit of making an euphonic combination between the final vowel of the stem and the initial vowel of the termination; thus the long I and a hold their place, unchanged by any commotions which might vex the termination.

In Gujarati the only change that occurs is in the oxytone nouns in o, which make an obl. in d. I have often before

mentioned that Gujarati strikes the student as an archaic dialect of Hindi, whose development has been arrested by its isolation; and it would be consonant with this view to regard the oblique form in d as derived from the full Prakrit dhi, by simple rejection of the final hi—a process which we have shown to be followed by the other languages. Beyond this there is no further change for the oblique in Gujarati; the termination in e belongs to the instrumental, which will be explained hereafter.

Marathi remains to be discussed; lumbering along as usual with its old-world Prakrit baggage of terminations, it offers many troublesome problems to the inquirer. In nouns with a consenantal ending it lengthens the mute a into d: as bap, obl. In Old-Marathi the nominative of bāpā; ghar, obl. gharā. nouns of this class, like the corresponding class in Sindhi still, and Hindi and the rest in former times, ended in u, the Prakrit barytone o. Thus we have देशह, कह, नन्तु, and the like. The Marathi consequently did not consider words of this class as ending in a consonant, nor does it now; technically these words still end in short a. Not having, like the Hindi, rejected this final vowel, and with it all power of modifying the termination, it has been able to retain the oblique form in a from ahi, merely rejecting the hi, as in the others. This it has been able to do in barytones, whereas the others only preserve this ending, softened to e, in oxytones. Similarly in a certain class ending in long d, it exhibits the oblique in d; but in this case it may be equally correct to regard the d as merely a retention of the form of the nom.; and this is rendered more probable by the parallel case of nouns in f and s, which also, as shown in the table, have no separate form for the oblique. The nouns in long vowels would be unable to form a separate oblique, because the oblique of the Prakrit would merely differ from the nom. by the addition of hi, as áhi, thi, úhi; so that when the hi came to be rejected, there would remain nothing. Marathi differs from Sindhi and all the other languages in being still bothered with notions of sandhi, and still hardens the final vowel of a stem before a termination beginning with a vowel. Thus in a class of nouns ending in â, i and û, it hardens the vowel before the universal âhi of the oblique, making from bhâû, bhâcd and the like. In musculines and neuters of this class, the Prakrit mass, form âhi has been used, leaving â: thus they say, bhâvâlâ "to a brother," which is bhâc-â(hi)-lâ; but in the fem. the Prakrit fem. is used. In these words so early as the Maharâshtri Prakrit, the fusion of cases had taken place. Thus in the feminines mâlâ, derî, bahâ, we find only the following narrow runge of endings:

माना "garland," acc. मानं, abl. मानाहि, Instr. Gen. Loc. मानाए. देवी "goddess," " देवि " देवीहि " " " देवीए. नह "wife," " वहां " वहां " " " वहां

The abl. differs very slightly in sound from the other oblique case, because e is short in Prakrit, and consequently to the vulgar ear the general type for the fem. oblique would be e. Thence it would result that in the words सास. स्त्री. after the final vowel had recrudesced into its semivowel, the form of the oblique to be added would not be d, as in the mase., but e, and we therefore find såsavelå, striyelå, which are såsav-e-lå, striy--c-ld. In this case the Marathi is more sensitive than the Prakrit, for it does not permit the hiatus where the other does. The principle of changing the final vowel into its semivowel having been once introduced, has been ignorantly extendedthrough the influence of that blind groping after analogies which has been so fertile a cause of change in many languagesto nouns ending in a; and as these have no semivowel of their own, the most frequently used of the two semivowels, I, has been applied to them, so that we get an oblique savarya from a nom. sasard. It is precisely on the same principle that the weak declension of nouns and the weak conjugation of verbs have gained so largely, and are still gaining, both in English and

German, on the old strong forms. The sixth declension in Marathi, namely that which we are now considering, is one of the weak declensions in fact, and as such has gained ground on the strong declensions. Another weak declension is that which comprises musculines and neuters in 3 and 3, which lose their final vowel and form their oblique as though their nom, had ended in mute a, or in former times in a. Thus cateara makes its oblique neither rátsarú nor vátsarara, but rátsara, where the final vowel of the nom. has been ignored, and the mase, oblique sign à has been added to a stem vâtear. On analyzing the words which fall under this class, it becomes apparent that in most cases the final a or an is a modern invention, and not organic. They are, first, words compounded with the Skr. 44 and Ha, in which the final u is short, and might thus easily be confounded in Old-Marathi with barytones of the a-stem like tal, so that they formed their oblique in a, and the lengthening of the final vowel of the nom. is only another instance of the fondness of Marathi for final long syllables: secondly, they are neuters ending in the diminutive syllables and & which, as I have shown in § 24, are in the other languages gr or gi, and to or ti, respectively, and thus come under the head of exytenes of the a-stem, and the oblique would regularly be d. There is, however, very great irregularity and confusion on this subject, the language not having made up its mind as to which of the three forms available it will use.

Nouns ending in short a, corrupted from feminines in Skr. in a, of which the type is [ARI, M. AIH, form their oblique by adding e, as AIH. This is the same rule as that followed in feminines in long t and a, and the e is the regular Prakrit oblique. Thus the Pr. obl. would be HIMIQ; but in this case, as the Marathi has lost the long a, it merely adds the e to the final consonant. This it does also in Tatsamas which retain the long a; thus HIMI makes HIM. Here I smell the Pandits. I suspect that the nom. had become HIM, as in Hindi, in which case the

form Mid for Midu would be regular, just as all for Midu; but the Pandits have subsequently restored the long a. It is no answer to this to say that Midi is found in the earliest writings in the language, because, in the first place, the writings are no guide to what the speech of those days really was; no Indian writer could ever resist the temptation to use grander and more Sanskritic words than occurred in the spoken language; the attractions of the so-called sadhu bhasha have always been irresistible; and, secondly, the formation of the oblique form took place long before the earliest writings that we have; and it is therefore quite possible that when the oblique in a was formed, the nominative in current use was Mid.

There is, as before stated, also another method of forming the oblique in use among the norms of this class, namely that in t, which arises from the fact of their being derived from norms which in Skr. ended in i, or t. In masculines of this class the oblique Prakrit is in this, in feminines it is in the, both of which have left in Marathi only t. Examples of this class are the following:

Skr. खाँच "fire,"	था. माम. वारियाः	मा. जा सम्मीहि.	M. NOM.	अ. 010. स्रामी
8kr. कुचि "belly,"	कृष्टिः.	कुक्शीह,	जुस,	वृसी.
Skr. मृद्धि "fist,"	मुङ्गि	मुट्टीहि,	मूड.	मूठी-
Skr. बोधी "assembly,"	गोड्डी,	गोड्डीए.	गोष्ट,	गोधी-

This last word is almost a Tatsama; it would be completely so had it not lost the final t in the nominative; it is used in the sense of "talk, gossip, conversation," also of "an affair, case, business."

§ 47. We now come to the oblique forms of the plural, which are in all respects simpler and more uniform than those of the singular. Hindi has but one form for all classes of nouns, namely wi, which must, I think, be distinctly referred to the genitive of the older languages. Sanskrit forms the genitive of the a-stem in with for all three genders; the nome and acc.

plural of the neuter end also in dui, which I have shown to be the origin of the nom. pl. in Hindi. The similarity of the genitive ending to that of the nom. has perhaps led to its preservation for the oblique cases, as in the period when the old inflectional case-endings had died out, and the use of the modern particles had hardly become fixed, there would be no distinction between the different cases of the plural; and Chand accordingly, as pointed out previously, uses such forms as stin, gain, both for nom, and obl. plural. In his Gatha passages, where he employs archaic constructions, we find a genitive in and, as in

# महिलानं मह सह नृपर्या।

"The sweet sound (made) by the anklets of women."-Pr. R. i. 17.

(मह = मधुर, सह = शब्द, नूपरचा = नुपुरचा instrumental of a fem. form °रा.)

Prakrit, in the principal dialect, makes its genitive in saul. and extends this form to all classes of nouns, totally rejecting the Skr. genitive in an used in so many bases. In fact the terminations of the a-stem have, as a rule, completely overridden and supplanted all the others. Hindi has rejected the final anuswara of the Pr. and turned the n into anuswara, and this rejection and softening are the probable causes of the present form in wit, the long vowel o having its origin in an effort to compensate for the loss of the n. Panjabi, which is not so sensitive, retains simply wit for the oblique plural. There seems to be no room for doubt that the Pr. genitive is the origin of these forms, because the other cases have a different type altogether. Thus the Maharashtri has instr. in chi or chin, abl, in sunto or hinto, loc. in esu, esun; and though the Aprabhansa has a different range of endings, yet they do not, on the one hand, approach the Skr. genitive, nor afford, on the other hand, materials for the construction of the Hindi oblique pl., the long o of which is in my opinion to be ascounted for by a still further lengthening of long d, a letter which occurs only in the

genitive. That the Hindi form is comparatively modern is shown by the fact of its not occurring in any of the middle-age poets, in whose writings the form in wife, we, or wee, is used for the oblique as well as for the nom. This is why I referred at the beginning of this section to the similarity between the nom, nenter in ani and the gen, of all three genders in anam, I believe that this similarity is the cause why no separate form for the oblique was struck out for so many centuries. It is a further confirmation of this view, that Gujarati, with its arrested development, has no oblique form for the plural, nor have Bengali and Oriya, both of which languages must have separated themselves from the central Hindi type certainly earlier than A.D. 1400, as we find Bidyapati in A.D. 1433 in full possession of a distinct set of forms. The Bhojpuri dialect of Hindi also does not possess the form in wi, but makes its oblique plural still in अन, as जीवन का, etc.; so also the Marwari dialect, which uses only wit, which, like the Panjabi form, is the legitimute descendant of Chand's plural in Min.

By the aid of this view the terminations in use in Sindhi are also explainable. The Apabhransa dialect, which is more especially connected with Sindhi, has fused all its plural endings into a small range of forms, as instr. chin, ahin, thin, ahin, abl. ahun, gen. ahan, nom. and acc. au. Only the loc. retains a distinct shape dsu; and even in this, when we remember the facility with which Sindhi changes W into W, it becomes probable that a form ahu would not be long in making its appearance. Later Apabhransa genitive forms in then, uhen, are also found; so that we really get as materials for the Sindhi oblique little more than one form with trifling variations. The oldest and fullest form of the oblique in this language ends in fa preceded in each class of nouns by the final vowel of the stem. Here we have the s or m of the Skr. forms wife and आनो, Pr. आणि and आणे, fused together. The other forms आ U, are readily deduced from the Apabhransa forms of and of

the vowel preceding which is merely a variant derived from the final vowel of the stem.

Precisely similar are the Marathi forms, which are strictly analogous to the singular oblique forms of each class, only differing by the insertion of anuswara, which evidently points back to the # of the Pr. gen., and preceded in each instance by the phonetic peculiarities which mark the singular.

On the whole, then, we conclude that in both singular and plural the terminations of the oblique descend from a general form produced by the fusion of all the oblique cases of Sanskrit; but there is this difference between the two numbers, that whereas in the singular no one case has retained its individual existence, or impressed its own special type upon the modern nouns, in the plural the genitive, by virtue of a special strength of type, and by its similarity to the neuter nom-, which had usurped the place of the other nominatives, has preserved its individuality, and in a great majority of classes absorbed into itself the other cases. It might also, however, be said that to a certain extent, even in the singular, the genitive has had the preponderance, as the form in fg, although its carliest appearance in Prakrit is in the capacity of an ablative, is yet more easily derivable from the Skr. gen, in we than from any other classical form. Thus, although the universal written Prakrit termination is wer, yet it is phonetically more natural that a form sfe should have arisen, which-by the operation of the tendency to change ₹ into ₹, a tendency which certainly exists in all the languages, though more extensively in the western members of the group-would become wie. It must be noted, also, that the change took place at a time when these western members were most powerful-Eastern Hindi, Bengali, and Oriya, not having then arisen. The period of the origin of these forms cannot be put later than the seventh century, when the decay of Buddhism brought about those great linguistic changes which laid the foundation of the modern languages; and at that

epoch the eastern parts of India were, as far as we know, comparatively sparsely peopled by men of Aryan race. A phonetic change, therefore, of the character we are now discussing, would naturally be in accordance with the tendencies and peculiarities of the western tribes who then constituted the immense majority of the Aryans.

§ 48. The forms of the oblique are not, however, the only traces which still survive of the old Sanskrit inflections. Simplest of all of these, the locative, which ended in **ए**, has held its own down to the present day in many languages. In the Oriya poems this locative exists, as **प्** "in the village," गींप "in Gop," though it has now been superseded by the analytical locative formed by र, and modern Oriya uses भीप र or गोप डार; in the latter of these डा= खान.

In Bengali it still survives, as in कोचे "in anger," भरे "in fear," चि "in a chariot." Here also, as in Oriya, the tendency to an analytical construction led at an early date to the addition of the particle ते, so that in Kasi Das's Mahabharat forms भरे ते. चि ते, occur, although pleonastic, and often more with the sense of an ablative. After nouns ending in long a, this ending takes phonetically the form of च, as भोडाच "in a horse;" but after nouns in other vowels, the modern termination ते is more usual.

Hindi does not know this locative form: having adopted s as the oblique ending for the only class of nouns in which it admits a separate oblique form, there was no room in its system for the special locative. Gujarati regularly retains it in all cases, with complete disregard of phonetic combinations, so that it is added to nouns ending in a vowel quite as freely as to those which end in a consonant. Thus we have the "in a custom."

AGU "in a tent;" but in nouns of the mase, o-class, in which the oblique differs from the nom., the change of termination is possible, and they consequently write TIRIS "in a day." So

also in the plural, which universally terminates in o, the e of the locative is added, giving oe, no account being taken of the fact that the locative of the plural in Sanskrit ends in uy. This is the way with the modern languages. Having got into their heads the idea that a certain termination is typical of a certain case, they stick it on to their nouns all round, overriding the more intricate distinctions of the older languages,

and thus gaining in simplicity and regularity.

Marathi has a locative in & universally employed in the older poets, but now going by degrees out of use. The form is the same for both singular and plural, and appears to have arisen from the Pr. locative in wifes, which in Bhagavatl appears as sife, or as Weber reads it sife. The later form was probably wife, which, by rejection of the a, is, strictly speaking, a portion of the stem, and throwing forward the anuswars, becomes fg. Marathi has by degrees got rid of the E, as in the similarly constructed forms of the oblique, and the lengthening of the final vowel is the usual Marathi custom. It agrees in practice with Gujarati, in using the singular form for the plural also. This may be pointed out as another instance of the preference of the Prakrits and modern languages for the older or pronominal declension, as this termination comes ultimately from forms like सर्वकिन .1

Panjahi resembles Marathi in having a locative in ?, which, however, is not restricted to the plural, and is not of very general use; thus, घरी "in houses," हथीं "in hands." In the singular, a locative in wi is occasionally found, as wei; but this is more strictly an ablative, and I suspect we have here, not a relic of a synthetical case, but an abraded particle, as will

be explained in another place.

The corrupt Konkani of Gon uses a locative in X, as Af & " on the bank," from तड. Skr. तट, where classical M. would have तडी. (Burnell's Specimens of S. Indian Dialects, Mangalore, 1872.) This is probably only a shortening of the Skr. locative in U+

In Sindhi there is a locative, but only in nouns of the u-class (=mute a). It ends in i, shortened probably from the Skr. s, as in \$\sum\_{\text{\$\mu}}\$, and not, as Trumpp writes, identical with the locative termination i, because this latter is not used in the declension of nouns of the a-stem, from which the Sindhi u-stems descend. Moreover, the declensional forms of the a-stem have to so great an extent swallowed up those of all the other stems, that we are hardly justified in looking to any forms but those of the a-stem, unless it be the old pronominal forms of words like \$\frac{\pi}{4}\$.

Besides the locative, several of the languages have also a relic of the old synthetical instrumental. This case in Skr. ended in the a-stem in caa; and Marathi retains this form shortened into the a-stem in caa; and Marathi retains this form shortened into the a-stem in caa; and Marathi retains this form shortened into the a-stem in caa; and Marathi retains this form shortened into the a-stem in caa; and the nome." Instruction has become customary to use a pleomatic construction by the addition of one of the modern particles are "by means of," so that they would now write are "by means of a weapon." Here, in consequence of the backwardness of Marathi, we are enabled to see in force a process which has occurred in the other languages also at a former time, namely, the gradual wearing away of the synthetical case-ending, and the consequent necessity for employing a particle to bring out the meaning more clearly.

Old-Bengali possessed also an instrumental ending in e, probably arising from the rejection of the na of ena. This ending being identical with that of the locative, was abandoned by degrees in favour of an analytical construction with particles, though it is even now occasionally used in collequial language. Instances from Bidyapati, the oldest Bengal poet (born a.p. 1433, died 1485), are as follows: जो प्रेम कुमवित कुमटा होए "that a virtuous woman becomes unchaste through love."—Padakalpateru, 980. मने किन्नु ना वननु को रसे मोज "in my mind I nothing counted, being foelish through that love."—Pad. 982. काजर सकन मदन धनु "love has adorned his bow with lamp-black."

—Pad. 80. जिल्ल सबद्दे करि आसम दाम "having made itself a seat by means of its own new leaves."—Pad. 1450. Kabi Kankan (A.D. 1544) also uses this case frequently, as बाहिर्ते इंड माता सबे कर बाज "from without all hung down their heads through ahame."—Chandi, 149.¹ In the same way it is used in many later poets, so that the existence of the form is well established, though it has been banished from the modern literary style.

Gujarati retains this form of the instrumental in ordinary use, though it, like M. and B., has felt it necessary to have recourse, to separate particles to define the meaning more fully. In this latter case, it is, as usual, pleonastic, having, besides the simple form देने "by a god," also the forms देने करोने and देने थी, as well as देन थी. With its usual disregard of the hiatus, Gujarati adds this a to the final vowel of nouns ending in i and a, also to the plural in o, as shown by the examples given in § 41. No traces of a separate instrumental remain in H. or P., though Chand in Gatha passages uses the Skr. forms, as stated above.

Sindhi is the only language which possesses a synthetic ablative, as \$30 "country," abl. \$31, with variant forms \$31. \$31. \$31. All these clearly proceed from the Sanskrit abl. in MG, as \$316, which in Pr. becomes first MET or MG, then MG, and in Apabhransa also ME. The variant forms morely testify to the unsettled state of this rude language, in which, from lack of literary cultivation, dialectic forms abound. It would seem that while the most correct form is \$315, the most used is \$31, and the anunasila appears to be nothing more than a modern inorganic addition, such as Sindhi is fond of. The first of the two masals in \$35 is also anunasika, and is merely the Sindhi method of softening a hiatus. Inasmuch as this form is purely synthetic, and not a mere case-particle, it naturally takes the place of the final vowel of the nom.; if it were a case-particle, it would not do so, but would simply be

15

<sup>&</sup>lt;sup>1</sup> This is the page of the Calcutta al. by Gopol Chandra Chakravarti, 1278, B.S. (1871).

appended to the oblique form. The form of the nom, represents the nom, of Prakrit and Sanskrit. Thus TE is the modern form of Skr. नरस; the Sindhi abl. नरां or नराउ represents on the other hand Skr. 4414, and has never had anything to do with the nom. " It is, therefore, not a correct way of putting it to say that the final vowel of the nominative is changed or dropped before this ending; on the contrary, it should be said that this case is derived direct from the corsesponding case of the older language. In nouns which end in 文, 文, 表, the ablative case results from the custom already adverted to, of using the case-endings of the Skr. a-stem for nouns of all classes. In Sanskrit, while न्रस formed its abl. नरात, नहीं made, not नहीं बात, but नवा:, वधु made its abl. asan: but all this was too complicated for the rustic folk. By far the larger number of the nouns in their language were of the type नरस, and the minority were soon made to follow that type too. So it came to pass that in Apabhransa the common abl. ended in hu or he, with the final vowel of the stem preceding it, as नराइ, नदीइ, or नदीहे, बहाहे, or कड़. Sindhi gons a step further than this. It knows only one form, MF; and this it simply sticks on to the stem, merely shortening the final vowel by the weight of the termination; thus, नोडी "rope," abl. मोडियां: मिक् " wild beast," मिक्यां. Thus that which was a bona-fide synthetical case in nouns of the a-stem, becomes almost a separate case-affix or particle in other nouns. This is, in my opinion, not an isolated instance of this process. If my method of interpretation be correct, there are, as we shall see when we come to the case-particles, several other instances of bona-fide synthetical case-endings having been broken off from the stem and used as particles. In the plural, this ending has come to be regarded quite as a particle, and is appended to the oblique form of the noun, as uvfewi "from houses," which is the obl. utfe+wi. It is easily seen that this ending has no business at all in the plural, as it represents distinctly the Skr. singular

form win; but so strong is the tendency to extend the use of one good simple form to all possible cases and classes, that no hesitation was felt in tacking the case-sign of an ablative singular on to a form derived from a genitive plural, in order to compose an ablative plural!

§ 49. In striking contrast to the wide range of synthetical forms observable in Marathi and the western languages, stands out the naked simplicity of the Bengali and Oriya, which have searcely any variations of the stem. With the exception of the now almost obsolete form in e, which did duty at once for instrumental, locative in the singular, and nominative in the plural, Oriya has no modifications of any kind; and Bengali has but one, the nom. plural in erd or rd. The question then arises, what is the reason of this difference? Why should two members of the group have so thoroughly emancipated themselves from the trammels of the old system, while the others are still so tightly bound up in them? The question seems to be parallel to that of the difference between English and German, the former of which has altogether rejected, while the latter has very largely retained, a synthetical type. In the case of English, whose development lies open before us, we can see the influence of the Norman race, -a race kindred in blood, and originally kindred in speech, to the subjects of Harold whom they conquered, but who had been put through a preliminary training by a long sejourn in France, as though purposely to 'fit them for the task of raising our rough English fathers to their present high position in the world. To the manly vigour of the old Norse pirate, the descendants of Rolf had added the grace and polish of the vivacious Frenchman. With that teachableness which was so pre-eminently their characteristic, they had sucked in all the awcetness and light which Europe then had to give. They came amongst us as a leaven of cultivation, and they made us what we are. On our language they worked a mighty

change; and it is to this that I would especially draw attention. They taught us by degrees to throw away all terminations as uscloss, retaining only a very few which were absolutely necessary. Under their guidance, the language softened and simplified itself amazingly. Gender was the first thing to go, artificial gender especially; even natural gender remained only in a few objects, and those indicated by uniform and regular methods. The numerous systems of forming the plural all fased into the addition of -cs or -s to the singular, and the case-endings disappeared, till at last our language stood forth clear and active like a trained athlete with his loins girt for the running.

It is something of this sort of influence that we should be disposed to seek for in Bengali and Oriya, and the difficulty of the inquiry is that we cannot find it. We may, however, guess at it, and there are scintillations afforded us out of the gloom of Indian history which confirm our guesses, till at some points they almost touch on certainty. The first of these is the fact, now almost beyond a doubt, of the very modern character of Bengali. The earliest writers in that language, the Vaishnava poets, use a language so much akin to Bhojpuri and the dialocts spoken in the eastern parts of the area occupied by the Hindi dialects, as to force on us the conclusion that the Bengali itself is nothing more than a dialect of Eastern Hindi. It is not till the beginning of the sixteenth century that we come to anything sufficiently marked to deserve the name of a separate language. Now long before that time, we know that Hindi had east aside the greater portion of its synthetic machinery. The only relic of the modifications of the stem consists of the e of the oblique of d-stems, as in \$21, obl. \$2. But it has before been noticed that down to a late period this form was not fixed, and the oblique ended vaguely in ahi. After a-stoms this would naturally take the form thi; and the rejection of the hi, which

See on this subject Grimm, Dentuche Grammatik, vol. I. pp. 694, 709 (first ed.), and Rapp, Comp. Gram. Verbal-Organismus, vol. iii, p. 163.

we have seen was a common process in all the languages, would leave an oblique base in a for the a-stems, and in a (mute) for the a-stems; or, in other words, there would be no difference between the nominative and oblique. Further, it must be remembered that Bengali descends from the peasant language of Bihar, in which, as I know from long residence in those parts, it is not eastomary to form the oblique of the a-stem in  $\epsilon$ , as it is in classical Hindi. The rustic of those regions will say ghord ke instead of ghore ko. The classical Hindi is not based on the speech of the eastern area, but on that of the western, and especially of the regions round about Delki and Agra. It is not surprising therefore that Bengali, an offshoot of the rustic dialect of the eastern area, should be ignorant of this peculiar The crude form in fg is very common in the Vaishnava poets, as duahi "to another" (anya), premahi "in love," karaki "in hand," and the like. Perhaps the rejection, so universally occurring, of the hi, arose from its being confounded with the common particle fg "indeed," and so being regarded as a mere emphatic addition easily rejected without If Bengali had attained an independent altering the sense. existence as a separate language at the early period when the other languages were passing through the stage of transition from synthesis to analysis, it would probably have struck out a course of action for itself. During all that period, however, Bengul was but thinly peopled, and its language was identical with Hindi, and it therefore partook of the changes which went on in that language. Its independent existence dates from a time when the sentiment of the necessity for indicating various relations of the noun by modifications in the terminal syllable had entirely passed away, and it does not therefore partake of any such changes. This modernness of Bengali must always be kept in mind in considering its present structure, because in recent times the language has been so overlaid with words borrowed from Sanskrit, in their Tatsama shape, that scholars

unacquainted with historical facts have been led to regard it as that member of the Aryan group which most closely approaches to the old classical speech, and to give it the position which is held by Italian in the Remance group. It is time that this misunderstanding should be removed. If we strip Bengali of all the Sanskrit words which have been brought into it during the last fifty years, and examine minutely its grammatical forms, and the true peasant vocabulary, we shall find that it is more removed from Sanskrit than any of its sisters, and it will stand out in its true light as a coarse rustic dialect destitute of refinement and precision.

With regard to Oriya, the same remarks hold good. We know from history that the Oriya race did not enter Orissa from the north, through Bengal, but from the west, across the mountains which separate it from the southern limits of Bihar. Many of the words of the language have the Bihar type of Hindi, and resemble Bengali only in those respects in which Bengali itself resembles Hindi. If we place the immigration of the greater part of the present Aryan element into Orissa at the beginning of the tenth century a.d., on the decay of Buddhism, it will result that the language which they brought with them from the valley of the Ganges must have been already to a great extent analytical; and their subsequent long isolation will account for the retention of forms which the onward march of the parent Hindi has long ago discarded.

In both these languages there is also great reason to suspect non-Aryan influence. Recent inquiries into the component elements of the Hindu population in both provinces lead to the conclusion that a large portion is still, and has always been, non-Aryan. In fact, it would not be going too far to describe the inhabitants of Bengal and Orissa as aboriginal non-Aryans converted to Hinduism by, and mixed up with, an immigrant element of Gangetic Aryans, whose language, religion, and physical type they have, notwithstanding their political inferiority, largely and deeply influenced. When the scholar whose non-Aryan dictionary has led us to expect a non-Aryan grammar from his pen, shall have given to the world the result of his labours, we shall be in a position to measure the extent to which the wild hill tribes and rude fishermen of the coast have reacted upon their invaders. At present we are not able to do more than hint at the existence of such influence; we can point out neither its direction nor extent.

§ 50. Marathi possesses a process peculiar to itself as far as the seven languages which we are working at are concerned, but which is also apparent in some of the cognate dialects which it has been necessary to exclude from the present inquiry, as Kashmiri and Pashto. In our seven languages the changes which take place in the stem are confined to the termination, but in Marathi a class of words exists in which internal modification is found. These are principally feminines in 表明, formed from masculines in to examples of which have been given in § 35. These words either reject the long ! altogether in the oblique, or retain it shortened to i, or change it to its semivowel च. 'Thus, Skr. भाविनी, M. भावीस 'a female devotee," obl. आवियो, where the i is shortened according to Molesworth; or भावतो, where it is changed to a according to Stevenson; and in either case the oblique termination in I is added, as in nouns of the form आग, obl. आगी. In cases like this it would probably be more logical to say that the noun retains its correct form in the oblique, while in the nom, it is lengthened in accordance with Marathi custom.

There is a large class of these words, and many others not derived from val are treated in the same way without regard to their gender; thus,

उदीर (m.) "rat." obl. उदिरा, उदरा, and even उद्रा-क्यों क (f.) "flour," ... क्यां के. sometimes क्यां की. क्यों स (a.) "ear of corn," ... क्यांसा- The Sanskrit originals of these words are det or det, and or after, and after respectively, so that the oblique represents the older form more accurately than the nominative does. The practice has even been extended to words of Persian origin, so deeply seated in the popular mind is the principle of analogy. Thus,

"a pack-saddle," M. खोगीर, old. खोगरा -- "reverence." M. ताजीम " ताजमे and °मी -"a chain-bow." M. खेजीम " खेजमी.

Similarly, in a large number of nouns of all three genders, a long a in the final syllable is changed to a; as,

Skr. सङ्ग्र "spront." M. चंक्र्, obl. चंकरा. सृत्ति "arrangement." M. जुमूत "trick," obl. सुमती-मचिका "dy." M. मासूक, obl. सासका.

In all these words, and they are tolerably numerous, there is no authority in the derivation for the long a; and the form of the oblique, in consequence, is due to the slightness of the difference in the vulgar pronunciation between the three short vowels. The above process, it must be explained, is only applicable to words where the vowel is preceded by a consonant; when it is preceded by another vowel, phonetic considerations induce a different process. The becomes hardened to a, and a to a, in such cases, at least in the Konkani dialect. In the Dakhini it is more usual to shorten the vowel, as are "woman," obl. Konkani are, Dakhini are. Thus Taka says.

तुका न्हणे चेती बाइले असडे। फुंदोनियां रडे हांसे काहीं॥

"Quoth Tuka, thus the good wife breaks out, sobbing also weeps and at times laughs."—Abhanga, 567, 3.

And of words in জ, ইজক "temple," ohl. Konk. ইবকা, Dakh. ইবকা; as again from Tukaram—

गाय देखळी देवापासी

"Sings in the temple before the god."-Abh. 560, 3.

Of the two forms, the Dakhini, which merely shortens the vowel, is the older and more natural; the Konkani agrees with what I have called above the weak declension of Marathi, which bears evident signs of being comparatively modern. It is, perhaps, a sign of the increased tendency to Sanskritize, that the old hintus, which neither Prakrit nor any of the moderns objected to, should have begun to be replaced by the semivowel.

§ 51. In noticing the peculiar ablative of Sindhi, I said that it was not an isolated instance of an infloctional case-ending having been detached and used as a case-particle. The other instances of the same process must now be exhibited, as holding a middle place between purely synthetical terminations, such as those of the locative and instrumental of Gujarati, Sindhi, and other languages, and purely analytical methods of indicating enses, such as the particles at, a, al, and the like. They owe their existence to the tendency, arising out of the general confusion and abrasion of case-endings, towards adopting for all cases one good strong form of the older language. It is the Darwinian principle of the "survival of the fittest," noticed in regard to the phonesis of the group at p. 27 of Vol. I., and by virtue of which the strong forms of the neuter nom. pl., and the common gen. pl. wife and wiet, have usurped all the cases of all three genders of the plural in Hindi and Panjabi. In the Sindhi ablative the form sag or wit is purely synthetical for the s-stem, but it has, strictly speaking, no business with any other stem; yet it has been applied to all stems indifferently. Consequently, in all but the u- and o-stems, which descend from the Skr. a-stem, it is no longer a relie of the purely synthetical system, but has half migrated into a case-particle. On the other hand, it cannot be classed with case-particles, as kd, ke, ki, because these latter are modern formations, not derivable from any caseending of Skr. or Prakrit, but independent words fused down into particles. I would therefore put these forms into a separate class, and call them quasi-synthetical forms; synthetical they are by origin, being derived from Skr. or Pr. case-endings; but they are not so in the manner of their employment, being used frequently in places where neither Skr. nor Pr. would use them, and sometimes even quite detached from the noun, and used with the oblique stem, which itself contains all that is left of the synthetical case-ending.

The first of these forms to be noticed is the Marathi ablative sign हन, which is now used as a case-particle, and appended to the oblique stem, as sing. utiss, pl. utiss; it is sometimes contracted still further into 354, and combined with the nom. form, as user. Lassen has long ago identified this form with the Prakrit ablative plural, which has two forms, ferit and मुक्ती; from a fusion of both arises अंती. This form is found in Early-Hindi. Thus Chand, केतीक दूर अजमर इंत । "How far is it from Ajmor?"-Pr. R. i. 178, and ugn fun fall gr unit a "Quoth the Siddh, 'from what city?"-th. i. 184. Here we have two forms, ga and saif, in the former of which the softening of the musal into anuswara is compensated for by lengthening the vowel, and in the latter the anuswara has been shifted forward on to the last syllable. Lassen points out that these two forms are both pleomatic or composite, that in femi being composed of the termination of the plur, instrumental ft, and that in well of the plural locative ending #, with the particle at, from Skr. at, an adverbial particle with an ablative meaning, generally indicating "from a place." The form-fewil thus means "from by," and is a causal ablative; that in god is "from in," and is a local ablative. Of course, with the fusion of the two forms into one, this distinction was lost, and, what is more important for our purpose, the distinction of number was by degrees lost too, so that in Old-H. and M. we have this ending used for singular as well as plural. M. has rejected the final al, and lengthamed the vowel, and the anuswara not being merely the anundsika or masal breathing, but a method of writing

भ as the first member of a nexus, having been restored to its full form, the result is the form अन.

In Nepali, a Hindi dialect of the eastern area, carried into the mountains by the last king of Simranw and his followers, when they fied there on the capture of their country by Tughlak Shah in 1322 a.n., occurs the ablative form fan "from," which may be, perhaps, connected with this form by a reverse process. If hinto and sunto could be fused into hunto, they could just as easily become sinto, and this form would result in sit. Nepali has not yet been studied scientifically, and its phonesis is as yet imperfectly known. In a brief memorandum on the language which I have, a tendency to favour the palatal sounds is observable, as in तिसी "ye," H. तुम, and the like; it is not therefore improbable that the form sinto would be preferred to hunto; and by a people so far east as the Nepalis, the preference for would not be felt. There is, however, another theory. which would derive sit from Skr. सहित. This is open to the objection that सहित means "with," whereas sit means "from." As matters at present stand, I do not venture to decide for either theory, but leave the matter sub judice, but with a preference for the former.

To return to Marathi. There is an older form of this case in wfat, wfa, the existence of which would seem to militate against Lassen's theory, as it is scarcely possible that hunto should have become hunigan. To this it may be answered, first, that these two forms occur in poetry, and the lengthening may be due to metrical causes; and, secondly, a confusion has probably arisen in the popular mind between this form and that of the Prakrit gerund in an Skr. in at. In this form also the old M. adds an in the word in the quotation from Tukaram perhaps utant. Pr. utan, in the quotation from Tukaram

And for which I beg to express my obligations to Dr. Wright, Residency Surgeon at Kathmaodo, who courtesusly complied with my request for information, by sanding this note drawn up by a Nepall Pandit:

in the last section, though modern M. now rejects this termination, and would write फंद्रन. This इयां does not seem to be organic, but a mere fashion of a certain period. There is always an element of confusion in words beginning with hu or ho, on account of their resemblance to the substantive verb #, which has from an early period sounded ho. It is then possible that the form hunto was regarded as a tense of ho "to be," and the shortened form hun would be confounded with the gerund होजन; and as this latter was subjected to lengthening into होजिनिया, so the ablative form may easily have been at the same period lengthened to siral. The principle of false analogies here at work is to be found constantly in all departments of language, and to it may be ascribed numberless eccentricities in the vulgar speech. Parts of the verb he are used in the other languages as case-signs. Thus Bengali uses its infinitive (originally a locative of the present participle) for giga, in the sense of "from," a usage only to be explained by supposing the idea to be that of having previously been at a place but not being there now, which involves the idea of having come away from it; thus घर हर्ते वास्त्राम, "I came from the house," would be literally, "in being at the house I came," or, as we might say in colloquial English, "I have been at the house and have come away." Similar is the use of hoke or hokar "having been," in the sense of "through" in Hindi; thus, to express "I came through Benares," one would say चना-रस होने आया है, literally, "having been in Benares I am come." It is not surprising, therefore, that the Marathas should have thought that हन "from" was contracted from होजन "having been;" and were it not for the Old-Hindi forms used by Chand, we might have been prepared to acquiesce in this view. As it is, however, Lassen's theory seems decidedly correct, and has been therefore adopted in this work. To this formation may also be ascribed the 'th of Panjabi locatives, as in uti. mentioned a few pages back, which is thus to be regarded as in

reality an ablative, and contracted from ut. In fact, the locative may itself be called an ablative of place, the meaning "in" being expressed by the ablative in many Aryan languages.

§ 52. Another quasi-synthetical form is the dative in Marathi which ends in 3, and is derived from the Prakrit genitive in 3, Skr. W, the dative having been early absorbed into the genitive in most Prakrit dialects. This form in Marathi cannot be classed with the locative and instrumental as a purely synthetic relie, because it has ceased to be restricted to those positions where it would occur in Sanskrit. In the parent speech, the genitive in asya belongs exclusively to the declension of the a-stem; in other stems, the genitive is formed by the addition of uh, and in some cases ah; the vowel is also rejected or amalgamated in some nouns of the i- and a-stems, and in some few classes the ending is uh; so that the singular genitive type may be generalized as simply visarga preceded by certain vowels, whose variations are determined by the form of the stem. But visarga is too weak a thing to last, it is almost entirely swept away by the Prakrits and their modern descendants, and recourse is had to the stronger form asya, or rather sya of the a-stem, with which also agrees the older pronominal declension. This is by the Maharashtri Prakrit applied to all mase, and neut, stems indifferently, thus

Pr. वच्छ "tree," वच्छस Skr. वृषस्त. - , चरित्र "fire," चरित्रस्त , चरे: ., चन्धु "friend," बन्धुस्त ,, बन्धी:

For feminine stems, however, Prakrit does not use this form, and even for those given above it has an alternative form in wit for the i- and u-stems; so that we may trace the ending systhum: in Skr. it is used only for the mase, and neuter genitive singular of the u-stem, in Maharashtri for all singular genitives, mase, and neuter, in modern Marathi for all datives of all three

genders, singular and plural. It has therefore, in the latter, come to be almost a case-particle; but, probably owing to its shortness, it is, as we learn from the grammarians, used in a somewhat restricted manner, especially in the Dakhin or central part of the Marathi area, in which a more correct form of the language prevails than in the Konkan or coast-line. The identification of this with the worf of the Skr. genitive would seem to be fatal to the theory which would derive the M. genitive in whi, etc., from w. The same form can hardly be the origin of two separate cases. This, however, will be more fully discussed in its proper place.

It is in Marathi more especially that traces of these quasisynthetical forms are found, though even in the other languages faint indications may be seen. They are valuable as supplying a link in the chain of development, and as showing how, as the spirit of inflectional construction and expression died out of the popular mind, the old case-endings fell into inextricable confusion, one swallowed up another, four or five fused into one, an ending peculiar to one case was appropriated to another, the distinctions between different declensions were obliterated, and the languages, like new wine left to settle in the vats, deposited all their sediment, and were racked off clear and sparkling. was all very well for a dreamy old Brahmin, who had nothing better to do with his time than to sit in the shade of a tree and doze over philosophical abstractions, to have a dozen different ways of declining his noun or conjugating his verb; and it was no difficult task for him to recollect each one of a vast growth of terminations and inflections: but life is too short now-a-days for such minutiae, the business of existence is too varied, and time is too valuable. The modern languages are not objects of pity, as having degenerated from a higher level; they are rather to be congratulated on having known how to bring order and simplicity out of a rank chaotic overgrowth of forms and types, and having thus become fitted for use in these bustling modern days.

Among the particles that are now used as signs of case, there are several which may possibly be classed as quasi-synthetical; but they are not given here, because some doubt still hangs over their origin and real nature. They will be duly noted in subsequent sections.

§ 53. Adjectives partake of the nature of substantives in so. far as their form and structure are identical with them, both being nouns, though the former are attributive, while the other are appellative. But as adjectives are generally coupled with substantives, and as these latter are the principal words in the sentence, indicating by themselves the object referred to, it is natural that they should do the bulk of the grammatical work, the adjective being merely appended to qualify the substantive, and not therefore requiring to be so accurately inflected or declined. In several languages the adjective, consequently, undergoes less change than the substantive with which it agrees. Here, again, we have the old common sense system of simplifying as much as may be. In Sanskrit, Latin, Gothic, and the older languages of the family, the adjective was made to agree with the substantive in gender and case, so that each adjective presents a triple declension, masculine, feminine, and neuter. Sanskrit sometimes shirked all this elaborate concord. Its array of declensional and conjugational forms was so formidable that Sanskrit writers themselves seem to have felt the burden of so vast an amount of wealth, and to have endeavoured by various tricks of composition to shake off the load. Thus the necessity of inflecting the adjective to follow all the varying phases of the substantive is to a great extent evaded by compounding the two together by the method known as Karmadharays, by which, whether, as is more common, the adjective precede, or, as also occurs, the substantive precede, only one inflection is used. Thus, instead of saying wild saud "a blue lotus," they combine the two words into one, producing श्रीसोत्पर्स, and thus,

when they require to use the genitive for instance, stained expresses the meaning quite as clearly as the longer state true true that in has not this power, and every one is familiar with the clumsiness that results when one has to string together a number of adjectives and substantives in the lengthy genitive plural forms -arum and -arum.

All that is really necessary in the inflection of adjectives has been retained in the modern Aryan languages, and much that is not necessary in some. So long as there exists some clear means of knowing which substantive in a sentence any given adjective qualifies, it is only needful to decline the substantive. Confusion can only arise in a few instances. Thus in English, when we say, "I have found an old man's cloak," we may mean the clock of an old man, or an old clock such as men wear, as distinguished from such a clouk as women wear; but even in this extreme case confusion can be obviated in our flexible language by a different arrangement of the sentence, and in nine cases out of ten the adjective would by its meaning indicate the substantive which it qualified. If we speak of a "blue sailor's jacket," the word blue can only refer to jacket, as such a thing as a blue sailor would be absurd, and we know that sailors habitually wear blue jackets. Such a language as ours is worthy of a civilized and enlightened race, because by its very absence of forms it assumes that those who use it are people of intelligence and do not require to have their minds guided to the meaning by the leading strings of synthetical forms. A Roman required this aid. To him "corulea nauto tunica" was a different thing from "carulei nauto tunica;" and had he been unprovided with the help supplied by the variation of the final letter of the adjective, he would have been at a loss what to understand. Thus we may say that synthetical languages are fitted for the childhood of the human race, analytical ones for their manhood:

Bengali and Oriya do not change the form of the adjective at

all, whether for gender or case; the adjective is placed just before the substantive, and one case-ending does for both. Hindi gives to those adjectives which end in a, a feminine in I, and an oblique singular in e, but does not make use of the oblique form of the plural. Thus one would say काने घोडे का "of a black horse," and not कोलों घोडों का "of black horses," but काल घोडी का. The reason of this is obvious. The adjective having been put into the oblique form, common sense shows that it must refer to the substantive in the oblique form, and there is no need for a closer method of indication. The speaker is supposed to be able to use his wits to this small extent. Panjabi. however, is conscious that its speakers' wits are not sharp enough to be trusted, and the adjective is therefore put through all four forms in each gender; as निकी आ जातां दा "of low castes" (f.), विटिश्रा घोडा दा "of white horses" (m.). This gives a clumsy appearance to the language, and ought not to be necessary for clearness.

The Gujarati adjective has all three genders with the typical terminations, wit mase. It fem., and it neut. The feminine remains unchanged for number and case, except that it optionally adds to the plural the universal o. The masculine forms its oblique in a, like substantives of the o-stem, and like them has the locative and instrumental in e, which ending is here also allowed to pass over into the ablative; the plural oblique is the same as the singular, giving in consequence a type quite analogous to its parent Hindi. The neuter differs from the mass, only in adding anuswara to the nom, plural. The range of forms may be thus drawn out:

The adjective is thus precisely similar to the substantive of

the e-stem throughout; and from the position which Gujarati holds in respect of Hindi, as well as from the analogy of Panjabi, it may legitimately be inferred that Hindi itself formerly had all these forms, though it has now got rid of some of them. Adjectives ending in a consonant do not undergo any change.

Sindhi declines its adjectives in the same manner as the substantives of corresponding terminations. It follows that adjectives agree in gender, number and case with their substantives, with the exception of that somewhat numerous class of words of Ambie and Persian origin which are not liable to change. Although the genius of Sindhi requires that every word should end in a vowel, either pure or masslized, and in consequence words derived from Persian ending in a consonant have the short vowel a added to them, as un from we, unit-मान from , بشمار, yet it seems to have been thoroughly understood and clearly felt that this final u was something different from the final u in pure Sindhi words, and it has therefore not been subjected to the changes which the rules of the language exact from indigenous words. The same reason has apparently protected Arabic words, whose un of the nominative, the tancin of grammarians, had probably died out of the popular speech of the Arabs before the period of their conquest of Sindh, so that the words at that time were as perfectly consonantallyending as Persian words, and had the a given them by the people of Sindh.

In Marathi the adjective takes, as in the other languages, the typical endings, at mase. I fem. I neuter, for the singular, and I mase., I fem. I neuter, for the plural. This type of adjective is the only one that changes for gender: all others, whether ending in vowels or consonants, remain unchanged. As usual with this language, there is some indecision in the forms used for the oblique. In the majority of instances the adjective merely takes the form yd, in analogy to those substantives in 4 which inser-

the semivowel in the oblique, and which grammarians call the sixth declension. The adjective may, however, take the form s, which is also used by substantives in d as the ending of the nomplural. Thus they say NET HUNTER or NE HUNTER "to a good man," and this pair of endings is used also with fem. and neuter substantives. Adjectives ending in any other vowel or in a consonant do not change at all.

It will thus be seen that there is in all the languages a tendency to deprive the adjective of its full range of terminations—a tendency based on the rational principle that such an elaborate variety of endings as the adjective is capable of affording, if expanded to its full limits, is quite unnecessary for clearness, and may therefore be dispensed with. In this respect even the Marathi, usually so prodigal of forms, has allowed itself to be influenced by practical considerations. Only the uncultivated Sindhi still retains all this useless apparatus, for which, perhaps, among other similar perfections, Dr. Trumpp would call upon its sister-dialects to envy it!

§ 54. The numerals, whose elegant and symmetrical development from the penderous Sanskrit compounds has been exhibited in § 26, are simple in their declension, taking generally the usual signs of plurality and case when required, but inasmuch as they are strictly adjectives, not often requiring any such signs. In B. and O. they possess no peculiarity; in H. there are only one or two points requiring notice. When special emphasis is required, or a numeral is used with reference to some object previously discussed, the plural form is used; but in this case it is the oblique form in in that is used, none of the nominative forms taken by the noun being customary. Thus we say that are the three brothers said," alluding to some trio of brothers well known to the speaker. The use of the oblique form is only another instance of the tendency of common forms to extend beyond their proper and original sphere into all and

every other as occasion may serve. The forms of the nom. plural of the substantive vary, but the oblique plural ends invariably in at, and this form therefore has acquired an ascendancy, and come to be regarded as the common and unmistakable note of plurality. As no numeral in Hindi ends in long a, there is consequently no opening for any change for the oblique singular, and we hear एक का "of one," दो को "to two," पदास से "with fifty," and the like. The habit of not using any grammatical forms which are not absolutely necessary has led to the almost universal rejection of all signs of plurality in a noun constructed with a numeral. If we say "fifty houses," it is evident that "houses" more than one are meant; what need is there to put the noun in the plural? पदास घर में "in fifty houses," is quite intelligible without any plural sign. It is thus that language gradually simplifies itself by the aid of a few natural reflections.

In Panjabi it is usual to add the plural sign to a numeral, as दर्भा अनुष्यां दा "of ten men," but this only in the oblique cases, and it would not be incorrect to omit it. Gujarati follows the Hinali customs in this respect.

All three languages, H. P. and G., treat their ordinals us common adjectives of the oxytone type. Hindi adds the terminations—

Panjabi the same; but it, as well as H. in many local dialects, still preserves the older ending in 和, 和, 和, 和, which is derived from the Sanskrit ordinals in 和; Whence comes the anuswara I am unable to say. Gujarati knows only the simple ending in m. 和, f. 和, n. 莉; pl. m. 和, f. 和, n. 莉 or 和. The anuswara in H. and P. is probably quite a modern addition, and begins only at the "fifth;" the first four, and the sixth, are regular (see § 27).

Marathi declines its cardinal numerals regularly after the manner of the substantives of similar form; thus एक "one," forms its oblique by adding d, as एका, after the model of maso, and neut, nouns in mute a (§ 41, cl. 1). In the feminine the oblique is formed by the addition of दे, as एकी, like आम, obl. आमी (§ 41, cl. 3). But the numerals दोन "two," तोन "three," and चार "four," take a new form in declension, with crude stems दोड़ी, तिही, चारों, which resemble the plural forms such as दोड़ी, तिही, चारों, which resemble the plural forms such as दोड़ी, तिही, चारों, in use in Hindi, as mentioned above. When they refer to persons, another set of forms is used, produced by the addition of चे to the shortened bases दो, ति and चो, thus making

M. Pl. Nom. दोघे, Fem. Nom. दोघी, M. Obl. दोघां, F. Obl. दोघां , तिथे, , तिथी, , तिथां, , तिथां, , चोधे, , चोधी, , चोघां, , चोधी

This process does not extend beyond the number "four," but is parallel to the practice, in the Bhojpuri dialect of Hindi, of adding all to a number when it stands alone; thus they say that "two," faral "three." And in Oriya the longer form altri is in use; thus altru "one (thing)," दूर बीटा "two (things)." In all Indian languages the practice of adding some word meaning "piece, portion," etc., to numerals standing alone, is common. The Marathi here differs from the rost by restricting the particle to persons. In Oriya बीटा means a "piece," and so also does the curtailed Bhojpuri form all; the derivation is perhaps from Skr. बीचव "family," in the general sense of a class or collection of persons or things.

Sindhi treats all its cardinals as plurals, and, except in one or two cases, inflects them as nouns with a regular oblique. Thus

ब् "two," Pl. Obl. ब्रिनि ट्रे "three," " द्रिनि चार् "four," " चर्नि

where the T of the nominative is dropped, as it is in the form

चौ used in compounds. In these three numerals the form of the oblique in द्वान is used; in the rest that in चान, as—

> पंत्र "five," Pi, Ohl. पंजनि-क्ष "six." , क्हनि-

As the words "two" and "four" have no neuter plural in ज in Skr., it is probable that the Sindhi forms have been extended to these words from द्विन, Skr. पीजि, gen. चयाआं. Prakrit विद्व The Pr. oblique of "four" is चर्डई or चरुन्द्र, from which चर्नि may have arisen, though we can hardly derive दिनि from Pr. दोन्द्र. It is more probable that the ordinary termination of the oblique plural of nouns has here been extended to the numerals than that these words have been separately formed from Prakrit originals.

The series of tens from 11 to 18, which end in ₹, drop the anuswarn as well as the σ which procedes the ₹; thus—

# यारहं "eleven," Obl. Pl. याहेंनि.

Similar to this is the Hindi dialectic pronunciation with "twelves," from with "twelve." The numerals in and v, as will "sixty," and will "nimety," are not inflected; will "eighty," however, takes an oblique with. When we get among the higher numerals, much of the sense of plurality is lost, and singular nouns are often in all the languages constructed with them.

The word #3 "one hundred," is in all the languages treated as if it were a substantive, and in Sindhi has a regular declension, as follows:

Nom. Sing. संख, Nom. Pl. सव or सा. .. Obl. सव, .. Obl. सवनि, सानि, सर्वे, सएं.

The numerals, however, often remain uninflected before a substantive, which saves a good deal of trouble.

Just as in Hindi the numerals, when treated as collectives, take the oblique plural, as चीसों बीसी बाडी "scores and scores

Sindhi often adds the emphatic t or M, as do also the other languages, to all cardinal numbers, to denote completeness; but Sindhi sometimes incorporates this emphatic syllable into the numeral, and adds the terminations to the word thus formed, as

द्वेर "all three," Obl. द्विन्ही, द्विन्हिन

but

चार्इ "all four," " चड्नी-

The ordinal numbers in all the languages are regularly inflected as adjectives in a: thus H. m. EUT. f. EUT. obl. sing. EUT. obl. pl. EUT. But Sindhi has added an annawarn to all its ordinals. The usual inflection of the adjective in with fem. c. must therefore be supplemented in all its forms by an anuswara superadded. Trumpp would derive this anuswara from the woof the Skr. termination with but this seems opposed to the analogy of the other languages, in which the m of will preserved, or softened into with the anuswara still existing, as in H. with the words, with the anuswara still existing, as in H. with the words, and we should probably concede to Sindhi greater regularity than to the others, and suppose that it is H.

and P, which are irregular. In the following examples Sindhi certainly answers to Trumpp's derivation:—

Fifth पंचम पंचमी पंजी but पांचवी-Seventh सप्तम सत्तमी सतीं , सातवा-On the other hand,

Eleventh एकाद्य एकारसमी काही .. इत्यारहवां. Twentieth विश्व वीसी वीहों .. बीसवां.

In these two latter there is in Skr. at least no तम to start from, and though Prakrit has एकाएमम, which would give बाइं, yet it has preforentially बीसो, which will not account for the anuswara of बीहां. It is true Pr. has also बीस्तिम, which would lead to बीस्ट्रमो; but the Sindhi form of this would probably be बीहेंचो, not बीहों, unless we suppose an elision of u and the throwing forward of the anuswara. In Panjabi, however, we have both the म and the anuswara standing together, as in सत्तमा "seventh," so that the latter certainly cannot here be a relic of the former. Chand's ordinals are as follows:

Ist प्रथम . 3rd तृती . 5th पंचम . 7th सर्त . 2nd दुती . 4th चर्च . 6th क्टं . 8th चर्ट . Pr. R. L. 5

in which, while the final # is sometimes written as a consonant, and at others as an anuswara, there is nevertheless nothing to indicate the source whence the modern terminations arose. The only way that they can be accounted for is by supposing reduplication of the #. Further research is required on this point.

§ 55. We now arrive at the most interesting and important section of our whole inquiry into the noun, namely, the origin of the case-affixes. Having rejected the synthetical method as a whole, and retaining merely certain half-effaced traces of declension, our languages have had to betake themselves, like their European relatives, to added particles, in order to draw out and express fully the various relations of the noun. These particles are placed after the noun, in contrast to the European method, which places them before it; but this practice is in consonance with the order followed by the mind of an Indian speaker, who constructs his sentences always in a sequence directly the reverse of that used in the languages of Europe, so that, in translating from an Indian vernacular, one has always to begin at the end of a sentence, and work backwards.\(^3\) A great deal has been written on this particular branch of my subject, but for the most in a desultory and inconclusive manner; and I hope, therefore, to be able to put together, in something like order and arrangement, the results of the inquiries of others, as well as my own discoveries and beliefs, so that, if the question cannot at once be settled, it may at least assume a more concrete and manageable form.

It may be assumed as a starting-point, that the case-affixes are remnants of nouns or perhaps pronouns, which have been cut down and worn away by use. I think it will be admitted by all philologists that any other assumption would be irreconcileable, not only with the fundamental principles of modern Aryan glossology, but with the universal laws of language. In the wide field of Indo-European comparative philology, the great master Bopp has conclusively proved that this principle everywhere pre-

The difficulty of following the sense of a long passage in a variancian document which this practice indices, will have struck many of my brother magistrates in India. Take the following, from a Police report: "To day at 1 which of the day A. B. watchman of village C. brought to the police-ctation a breas drinking vessel and platter which he found during his resunds has night on the edge of the public road leading from D. to E. at the south-western corner of the pond lately repaired by the Manager of the estate of Raja F." This would can in Hengali thus; "To-day of the day one watch of village C. watchman A. B. of Raja F. of the satate by the manager lately repaired of the pend at the south-western some from D. to E. leading of the public road at the edge by him last night his rounds during found of brees a drinking reasel and platter to the police station having brought; em." All the variations are the fourth page and comes at last to the only finite verb in the whole, "I have reported it."!

valls, and that even the synthetical case-endings of the early classical languages are relies of independent words. It is therefore safe and rational to assume that in the languages of which we are treating, allied as they are closely and indissolubly with the old mother-speech Sanskrit, the same sentiment exists, and the same method of word-building still survives. Throughout the material world we see that the process of reproduction is one of such a nature that it can be repeated time after time for ever. Man begets man throughout the ages, and tree produces tree; the mountains are washed down into the sea, and the forces at work in the bowels of our planet upheave fresh mountains, which are in their turn washed away. So also in language, words originally independent are seized and bound into slavery to other words, become case-affixes, are incorporated into caseendings, and are finally abraded altogether. Then the mind seizes fresh words, and binds them into slavery again, till they also wear out by use; and, if the world lasts long enough, will in their turn pass into case-endings and disappear, and a third set will have to be captured and made use of. The process repeats itself, and the modern Indians, when they had recourse to the words which have become the case-affixes of to-day, only did what their remote uncestors had done before them, when they took prenouns and nouns and made them into the terminations which Sanskrit literature has preserved to us, such as -ena, dya, asya, and at.

Literature, however, has a tendency to arrest the process of change; and the modern languages of Aryan India are so rapidly becoming cultivated literary tongues, that we may suppose that they will not in future develope so quickly as they did in former times. The literature which they possessed before the advent of the English schoolmaster was not of a kind to influence greatly the spoken language, but rather held itself proudly apart, and looked down on the folk-speech. Even in the present day this silly feeling is strong. A generally sensible writer like Bankim

Chandra, the editor of that excellent Bengali magazine the "Baugadarsana," for instance, in writing a serial novel, puts into the mouth of one of his characters the familiar word "diyasilai" (meaning a match for lighting a candle); but in the very next line, when writing in his own person, uses the highflown Sanskrit equivalent "dipasilaka," though he knows perfectly well that for a thousand Bengalis who understand the former, not ten would know the latter word. It is to be hoped that this sort of nonsense has had its day, and that in all the seven languages literature will by degrees become more natural, and that men will begin to see that there is no disgrace in writing as they talk.

But this is a digression. To return to our subject. It follows from what has been said above that we must look for the origin of the case-affixes in nouns of the older language. It follows also that the nouns in question must have been in use at the period when the modern languages began to be formed, -in other words, they must have been words of the lower and more popular dialects of Prakrit. We should hardly be justified in looking for them in scenie Prakrit, but rather in Apabhransa. The argument used by scholars in Europe, that the dialect of the plays and of Hala's songs must have been a spoken dialect, because players and dancing-girls could not have used a language which their audience did not understand, has in reality very little weight to the mind of one who has lived long. in India. It is a curious but quite undeniable fact, that dancinggirls do in the present day sing many songs which only the educated portion of their hearers can understand, or, if the humbler and more illiterate part of the audience do understand them at all, they do so, not because the language is that which they themselves speak, but because it is fine talk, such as they hear their betters use. In an Indian language there are always three or four shades or strata of talk existing side by side at the same epoch. Thus there is in the Bengali of to-day the highly

Sanskrifized style of the pandit, the somewhat artificial, but less Sanskritized style of gentlemen of education and refinement, the practical every-day speech of the middle classes, which contains only the simpler Sanskrit words, the strange jargon of the women, and the rough homely patois of the peasantry. It is quite possible for a foreigner to know one of these languages, or strata of language, without knowing the other. It often happens that the English indigo- or tea-planter, mixing only with the lower classes, speaks with fluency the peasant speech, while the high official speaks equally well the dialect of the educated; and the planter cannot talk to a native gentleman in the habitual dialect of the class, nor can the official understand the peasant without an interpreter. These things are so now, and they probably were so a thousand years ago, and, for aught we know, will be so a thousand years hence; and we are therefore justified by experience and analogy in looking to the lower or Apabhransa dialects for the origin of modern forms-all the jargon of Hala and the plays notwithstanding. I shall now proceed to exhibit the results of such investigations as have up to the present time been made by myself and others, taking each case-affix separately.

§ 56. The Objective. Under this head are classed the accusative and dative of the Sanskrit. Prakrit had already lost its dative, and the modern languages make, strictly speaking, no distinction between the nominative and accusative. There remains therefore no way of designating that form which the noun takes when it is the object of an action but that of "objective." Marathi alone has a distinct quasi-synthetical dative, which, as we have shown above (§ 52), is a descendant of the Sanskrit genitive in asya.\(^1\) In Marathi, however, as well as

<sup>&</sup>lt;sup>1</sup> The Gipey language has also an objective in \$\delta\$, which is used only with mean-line nouns and in the singular; thus Zhou "a gipsy," obj. ramés; ras "a lord," obj. ramés; rasks (H. lerks inversed) "a boy," obj. raskies—Paqueti, p. 30. The some form occurs in Kashmiri, as order "sinther," obj. sublis; nicks "child," obj. nicks to

in the other languages, there is no sign to mark the object. In H. घर गिर गया "the house fell," we have the same form as in घर घनाया "he built the house." When it is thought necessary to emphasize or express the state of objectivity—a question the discussion of which pertains rather to syntax than to formlore,—the following particles are added to the oblique form of the noun:—

Hindi	 179	×	ka.	Morathi						
Panjabi				Bengali						
Sindhi				Oriya .	4	(*	×	53	E.	ku.
(injaruti				Nepali .	i	9	0			ut.

These affixes are the same both in the singular and plural. Of the seven languages H. S. B. and O. fall into one group, P. M. and G. into another.

The H. affix ke is softened from an older form \$\frac{1}{47}\$, which is still in use in the Braj Bhasha and many other rustic dialects. An older form still is \$\frac{1}{48}\$; and the oldest form of all is that found in Chand, \$\frac{1}{48}\$. The form \$\frac{1}{48}\$, which Trumpp¹ hastily affiliates to those given above, I hesitate to connect with them, believing it to belong to a different root altogether. What, then, is the origin of this affix? It is derived clearly from some noun, as I have already shown reason for believing; and the problem is—What is that noun?

Of the use of wit it is unnecessary to give examples, as the form is in common daily employ. Similarly, wit is to be met with on every page of a Braj Bhasha poem.

common. Thus, in the Ramayan of Tulsi Das-

## खधि सिधि संपति नदी सुहाई ॥ उमिन चन्ध संबुधि कहं साई॥

Ayudhya Kanda, 7.

"Prosperity, success, wealth, (like) fair rivers Overflowing, came to the sea of Avadh."

Sindhi Gr. p. 116. The author also errs, in my epinion, in considering the anasydra in \$1 a modern addition. It would rather mean to be the older form of the two.

# नुप युवराज राम कई देह ॥

Ayedbyā Kānda, 18.

"King, give the heir-apparentship to Ram."

## सस कहि नाइ सवनि कई साथा॥ मलेव हरपि हिंच धरि रधुनाथा॥

Sandara Kimia, 8.

"Thus having said, bowing his head to all, He went rejoicing, holding in his heart Raghunath."

It occurs on an average ten times on a page throughout the poem, and in some of the recent lithographed editions is regularly written \*\* a point to which I shall refer again presently. Sur Das uses \*\* at, and \*\* but not, as far as I know, \*\* or \*\* It is impossible to speak with certainty, as it would take half a life-time to read through the vast ocean of the Sar Sagar.

Chand uses several forms, but the anuswara is retained in all, thus showing that it is not a mere modern addition. His forms are \$1.51, and \$5. We cannot tell how far Chand's forms have been modernized by copyists; but that \$5 is a true form, and not a copyist's error, is evident from the fact that in the places where it occurs, it is demanded by the metre, and occasionally appears with the final vowel lengthened in cases where a long vowel is wanted. Instances of both \$5 and \$5 are—

# वरी मु सोई तुम एक कई ॥

"He seeks one of you."-i. 88, 9.

## पात समें वर दुजन कहें। वादि अप्य कर दीन।

"At morning-time a gift to the Brahmins Dividing with his own hands gave."—vii. 5, 3-4.

This latter would run thus in Modern-Hindi-मात के समय बर दिजी की, बांटकर अपने साथ से दिया।

# करि दण्डीत सवन कई।

"Having made obeisance to all."-vi. 38, 3.

#### वीसी कहि मी कई इर पायज ।

"Having thus said, you find (i.s. cause) fear to me."-1. 160, 1.

## प्रिथिराज माहीवे जुद कहा। हम परिमाण गुलाइव ॥

"For the war with Prithiraj at Mahoba, Parimal has summoned us."—xxi. 84, 6.

Of earlier forms than \*\* we have no examples, and the gap must be filled by inference. Where actual evidence fails, we do not, as some carping critics say, fall back upon mere guesswork, but, applying the known laws of phonetic development, endeavour to reconstruct an older form, and are not guessing any more than Owen guessed when he reconstructed an extinct animal from one bone. We cannot do this; but it may be possible to get to a step or two further back by analogy. It is admitted that initial letters seldom change (see Vol. I. p. 190); we therefore assume on good grounds that the \*\* of this word has come down unchanged. Further, \*\* generally results from the dropping of the organic portion of an aspirated letter; and \*\* as a termination represents the Sanskrit termination of the nepter in \*\* am.

The following theories have been advanced, based on the above, and similar well-known phonetic processes. Trumpp (Sindhi Gr. p. 115) derives from Skr. \$\overline{\pi}\$a, which he supposes took the form fant, and he thus clides \$\overline{\pi}\$, which, on going out, aspirates the preceding consonant, thus producing the Sindhi \$\overline{\pi}\$; the Hindi \$\overline{\pi}\$ he derives from \$\overline{\pi}\$a, through Prakrit forms \$\overline{\pi}\$a, fant, and he theory fails, as it has been shown above that the older forms contain an \$\overline{\pi}\$ and anuswars, neither of which could be got from Trumpp's process, and there is no reason to suppose that \$\overline{\pi}\$ has a different origin from \$\overline{\pi}\$. To account for the \$\overline{\pi}\$. Trumpp supposes that the \$\overline{\pi}\$ of \$\overline{\pi}\$ on going out aspirated the following consonant, thus producing \$\overline{\pi}\$. That \$\overline{\pi}\$ would naturally produce \$\overline{\pi}\$, \$\overline{\pi}\$, and perhaps even the allied form

表表, is undeniable; the only difficulty is in getting to 表現 from 表表. There is another way by which, still retaining 表表 as the origin, we may account for the ₹, namely, by supposing that when 表表 had become, as we know it does in Prakrit, 表表 and 表表, the next step was to clide the ₹ (Vol. I. p. 202), thus getting 表表; but the place of a single consonant which has been lost by clision is often supplied by ₹ in Prakrit, and by this process a form 表表 is obtainable.

The weak side of all this argument is that sad does not commend itself as a probable origin for an affix meaning primarily and generally "towards." Trampp says that in Skr. and is used as an equivalent of 要有 in the sense of " for the sake of," " on account of," "as regards." But even if this statement be true of classical Sanskrit, it is doubtful whether the use of Ed in this way was ever sufficiently common among the lower classes to have given rise to so very common an affix as the say of the modern objective. It is difficult to see how a word primarily meaning "that which has been done" could come to mean "on account of." With sed and sed there is no such difficulty, because these words mean respectively "in that which has been done," and "by that which has been done;" and the transition from these senses to that of "on account of" is easy, resting as it does more on the acknowledged meaning of the locative and instrumental cases than on the root.

The Sindhi objective affix & khe, can, without doing violence to probability, be admitted as an offspring of En; but the mind is not easily satisfied with the parallel affiliation of 1 to En.

As far as concerns the meaning, a more probable origin for all is that partially suggested by Hoernle (J.A.S.B. 1872, pt. i. p. 174, et seqq.), who, however, has not traced the steps of the trans-

<sup>&</sup>lt;sup>3</sup> Wober, Saptantakum, p. 29. "Es schemt vielmehr das å in dissun Philien nur als eine Art spiritus lenis zur Vermeidung des Hintus gebeuncht zu sein, abnlieb wie im Magadht der Jaina des y, in einigen Pallen aber auch A selbst oder s verwendet wird (Rhaguvati, i. 390, 609, 411, 426)."

ition correctly. The meaning of an being evidently, in the first instance, "towards," "near," and the like, we are led to look at the analogy of Bengali, in which language wie means "near," and is used with a genitive as an independent postposition, as नाहार काई "near him," or "in his possession," or "to him." Now this word wie is from the Skr. we, locative of we, and means literally "in the armpit," or, as we should say, "at the side." जब becomes in Old-Hindi काज, and the necusative जब would become first was, then wire. As to, like the rest of the aspirates, migrates into g, a form and is legitimately presumable; whence, by shortening the vowal, we get the already catabilished form at, with its variant ag. I confess that this derivation approves itself to my mind in preference to any other. दाव, as a substantive, meaning "armpit," is in common daily use in the present day. It is a Tadbhava of somewhat later origin than those very early Tadbhavas which have given us the adverbs and case-affixes, and it is therefore no objection to this derivation that the case-affix should have undergone more change than the noun. As a parallel instance may be cited the adverbs like wet, wet, where wis all that remains of the we of wild, which word, when used as a noun, has kept the fuller consomental form यान. When used as a noun, the word कद loses its final inherent a, and becomes a barytone monesyllable; but the affix comes from the accusative, which is used adverbially, and consequently retains its anuswara. 443 - 418, 41, is equivalent to सम = सी and स्तार्ग = टार्ज-

and actually occurs in a place where the metre requires a long vowel, in Tulsi Das's Ramayan, Ayodhya Kanda 330:-

# निखत सुधाकर निखि गा राह ॥ निधि गति वास सदा सव कार्ड ॥

"In writing the moon Rahu has been written, Fate is always crooked to all," unless we here take बाह्र without annswara to mean "why;" but this is strained, and does not account for सव.

In confirmation of this derivation as regards the meaning, a matter in which Trumpp's derivation fails to satisfy, it may be further added that in modern Urdu the same method is still adopted, though with a different word. The Arabic word warmpit," is always used in the sense of "near," "close by," "to;" thus with a different word."

Hoerale is, I think, wrong in saying that wit is derived from Bengali with, as it is impossible to derive a twolfth-century Hindi word from a fifteenth-century Bengali one, and Hindi is the parent, or at least the elder sister, not the daughter, of Bengali; but Hoerale has certainly, in my opinion, indicated the direction in which we should look for the origin of the word, and I believe the steps were as I have shown above; and further research will probably establish the intermediate forms for which we have at present no actual proof. A striking analogy to the assumed genesis of with from which arises from Skr. qui, from qui "a side," through que and que, which last form is actually used by the early poets.

The Oriva of may be considered as a mere variant of the Hindi of, which itself, in the corrupt dialect of Hindustani spoken in Southern India, sounds of. The Orivas do not pronounce the of at all fully, but give it a soft short sound, which it is very difficult to distinguish from of. The Telugus, the mear neighbours of the Orivas, with whom they have for centuries had close intercourse, also mark the accusative by a form of. Telugu, however, being a Dravidian language, is not in any way connected with the languages of our group, though, as it has received a large number of Sanskrit and Prakrit words, there are often great similarities between it and Oriva, and it is singular that the structure of the verb also is very similar. Dr. Caldwell (Dravidian Comp. Gr., p. 225) asserts the identity of

the two forms; but we have already traced the Hindi ke to an earlier form \*\*Eff\*, which, whatever be its origin, is distinctly an Aryan word, and has no connexion with the Dravidian affix. The Telugu affix is as often sounded ki as ku, the vowel varying according to the final vowel of the noun to which it is affixed; thus Hari makes Hari-ki "to Hari," but dorn "a lord," dorn-ku.

Bengali ordinarily in its earliest recorded forms, in the Vaishnava hymns, does not mark the objective any more than early Hindi does. When, however, it is necessary to indicate this case, we generally find it noted by the affix 7, which still survives in the so-called dative of the modern pronoun. In this early stage we also occasionally find the Hindi crude affix hi. Instances of ? are common in the Bengali Mahabharat of Kāširām Dās-a book much beloved and bethumbed by the ordinary Bengali shopkeeper. Thus वृद्यमुले वसि राजा कर्न्नि affire a "sitting at the root of a tree, the king said to Bhima." -414. a. 5.1 जलपान करियोर जाय सरीयर "to drink (lit. to the making of a drink) water he goes to the lake."-415, b. 25. पानिपाद लये जाय जानिवारे बारि a "taking a water-vossel goes to fetch (lit. to the bringing) water,"-ांठ. 40. अस पाये जी कणोरे डांब गणवती a "Feeling fear the virtuous woman invokes Sri Krishna."-416, a. 2. These examples have been taken from the first page that I happened to open; many hundreds of others may be called from Bengali poems. It will be seen that in affixing this ? to nouns ending in mute a, an e is inserted; thus work, instead of wurt. This practice results probably from the addition of the emphatic e to the singular nom., instances of which are common; thus Bidyapati तेळ्न तथा चनुरामे ॥ "of such a kind is thy love."-Pad. 984. U सचि बाह बहसि बन् योगे । कान से अभि करनि प्रेमभोगे। "Ah! dearest, why dost thou question? (lit. make the question). Even now thou shalt make the

<sup>&</sup>lt;sup>5</sup> Calcutts edition, published by Maheshchandra Ghose, 217, Chitpers Rand, 1872.
The first number is the page, the letters a and b denote the column (there are two is each page), the last number is the line.

feast of love with Kanh."—Ib. This form is really the nomplural; and when used in the singular, thus naturally carries the idea of abundance or emphasis—an idea, however, which soon fladed, leaving the poets free to use the s pleonastically whenever it suited their metre.

The explanation of the origin of this form is, according to Trumpp, with whom I agree, to be sought for in connexion with that of Marathi, Nepali and the other languages using an affix whose characteristic is , to which we shall come presently.

The modern Bengali uses instead of \$\circ\$ the form \$\circ\$. New Bengali is very prone to softening \$\delta\$ into \$\epsilon\$; in ordinary conversation one constantly hears this pronunciation (Vol. I. p. 142). Thus \$\circ\$ (Vol. I. p. 142). Thus \$\c

Passing from the group whose characteristic is \$\overline{\pi}\$, we come to that whose characteristic is \$\overline{\pi}\$, of which the most important member is Marathi. In that language the dative affix is \$\overline{\pi}\$, and in the earlier language \$\overline{\pi}\$ and \$\overline{\pi}\$ allied to which is the Nepali \$\overline{\pi}\$ abstance obtained by elision of the \$\overline{\pi}\$, whereas Marathi has rejected the whole of the last syllable.

From the root we there is a large host of derivative forms, both verbs and particles, in all the seven languages; and as the root means primarily "to stick," it would naturally be adopted to express the idea of nearness or adhesion, which is very suitable to the objective. The simplest form in which it occurs is perhaps Hindi we, meaning "up to," "as far as;" but owing to the facility with which we and we interchange, Hindi has in some rustic dialocts an affix of or we ariginally we, used with the dative. This still survives in the neighbourhood of Delhi, as, for instance, in the proverb quoted by Elliot (Races of N. W. P., vol. i. p. 5):—

#### षपनी बोई जाप खाएं हाकिस ने न दे दाना

"What they sow they eat themselves, and give not a grain to the ruler."

It also survives in G., which marks the objective by #. The form # is found in Chand:-

## बालप्पन पृथिराज में ॥ निसि सुपननार चिह्न ॥—॥. ३.

"In his youth to Prithiraj, In a dream at night (came) a sign."

and

## पृथिराज मुनि कुंचर ने ॥ जाप नुसाए हित ॥—v. 13.

"Hearing it, Prithiraj himself Invited the prince kindly."

This is, I now think, the correct translation, though I formerly translated the passage otherwise (J. A. S. B., vol. xlii. p. 165), which translation led me into difficulties about the construction, which are obviated by taking out was the objective.

Marathi has lengthened the vowel of the root, but Hindi has not; and it is to a participial form जान, the meaning of which would be "adhering to," "close to," and finally "to," that we must attribute the present affix. जान becomes जर, and then जे, जे, and जे. The anaswara would thus be an inorganic addition, common in Hindi. From जन्न, a regular Prakrit form of the relative participle, by a similar clision of ज and conversion of ज into ज, comes the Panjahi objective ज for जड़, where the final ज has been weakened into anuswara. Analogous to this is the form जो, contracted from जन, in Old-Hindi used in the sense of "up to," "until." Thus Kabir:

#### वह जी वहीं अचेते मथक 8-Ramaini, s. 40.

"How far shall I tell (of them)? they have gone into unconsciousness," literally "till where?" And again

# ती को तारा जगमगै जी को उने क सूर ॥ तो की जिय जग कर्म बस जी की स्थान क पूर ॥

Sakhi 201

"So long (only) shines the star as the sun does not rise,

So long (only) do worldly works suffice as knowledge is not full;"

literally "until that (time) shines the star until which (time) the sun does not rise."

In a precisely similar way Chand uses will, as

## वहां जीन समुता वरनवें।

"How long shall I describe my inferiority?"-1 22.

The other change to which w is subject, namely that into ₹. yields the Bengali objective ₹.

In Gujarati works the affix of the objective is sometimes written without the annawara, and thus resembles one form of the genitive affix; but it will be shown hereafter that the resemblance is accidental only.

§ 57. The Instrumental. This case possesses a special importance in the seven languages, from the fact that in most of them, owing to the peculiar system of prayoga or construction which prevails, it takes the place of the nominative before verbs in the past tenses—a practice which makes these languages in this respect difficult to foreigners. In the cambrous Marathi especially, the correct use of the prayoga is a sort of pass asinorum to beginners, and even in some instances to natives themselves. The forms of the instrumental are these:

Hindi . . . . . . nc.

Marathi . . . ney. eg, sig, pl. uip, hip, sig.

Gujarati . . . . .

Nepali . . . . . le.

Sindhi has no form for this case, but uses the simple oblique or crude form without any affix; so also do the early and middle age Hindi poets, as will be shown in the latter part of this section. Gujarati, in addition to the c, which may also be regarded as originally merely the crude form, has also certain pleonastic affixes; thus it writes a will. For any "by God," "by means of God," also For will, or For will, which latter is strictly an ablative, and will be considered under that case.

Bengali uses the direct prayopa or construction in the past tenses of verbs, and has no need of an instrumental to take the place of the nominative; but when it requires to indicate instrumentality, the literary language employs such words as कठूक, कर्णक, द्वारा, पूजक; while the common speech uses the participles of the verbs "to do" and "to give," करिया "having done," दिया "having given." Both high and low alike also borrow the affix of the locative त, as in Gujarati the ablative.

Oriya, like Bengali, has only the direct prayoga, and, like it, supplies the place of an instrumental by art and similar words, and colloquially by at "having given," and such like words; but the instrumental is very rarely used in Oriya, the locative affix a usually supplying its place.

The Gipsy uses sa in the singular and ja in the plural, but as a pure instrumental only, and not as a substitute for the nominative.

In those languages in which the past tense of the trimsitive verb requires the instrumental construction, the verb does not under those circumstances agree with the nominative case. There seems, however, to be an exception to this rule, if my informant, a Nepalese pandit, be correct, in the Nepali language. The pandit gives the past tense thus:

> में में खायां "I ate," ते ने खाइस "thou atest," उस ने खायों "be ate,"

हामी ने सार्थ " " se ale." तिभी ने सार्थी "; s ale." उभी ने सार्था "they ale." In this paradigm we see that the verb changes its termination in each person, whereas in Hindi it remains fixed, thus: अं आया, तू न खाया, etc. The peculiarity of the Nepali usage is undoubtedly to be explained by the fact that this form of the instrumental has become so completely identified with the nominative as to be mistaken for it by the vulgar; and in all probability, as I shall endeavour to show, the use of the क (= Hindi क) is a mere modern custom, and originally the direct construction was used, and they said म खाया.

Although the question more strictly belongs to syntax, yet, in order to establish the correctness of the theory as to the origin of the instrumental affix which will be brought forward in this section, it will be advisable to give a brief description of the question of prayogas as they exist in the modern languages.

The prayogus are three in number: kartari, karmani, bhûre, which may be Englished respectively, subjective, objective, and impersonal; and what they are will be understood from the following Latin phrases:

Kartá. Bex urben condidit. Karma. A rege urbs condita. Bháva. A rege urbi conditum est.

In the first the verb agrees with the nominative case; in the second it agrees with the object, and the subject is in the instrumental; in the third the verb is impersonal and neuter, the subject in the instrumental, and the object is generally in the oblique form.

The Karta prayoga is generally employed in the present and future tenses; the other two in the past tenses. In Marathi the potential, however, takes the Bhaca as well as the Karta; and in all the languages except Marathi the Karma and Bhaca constructions are restricted to transitive verbs.

Having thus briefly stated the general system of construc-

tions, we return to the instrumental case of the noun, which, it will be seen, occupies the place of the subject in two of the constructions. It is, in the first place, necessary to observe, that in Gujarati there is an additional form of construction, in which the subject is in the dative case; and this is, strictly speaking, the Karmani construction: for in native grammars the dative, as well us the necessative, goes by the name of Karman or Karma, just as we have in these pages called them both the objective. The construction with the instrumental would more accurately be called the Karane, Karana being the name for that case. Secondly, not only in so archaic a language as Gujarati is the dative used indifferently with the instrumental in the frequently occurring constructions noted above, but in Nepali the forms of the case-affixes are very similar, the dative having wit, the instrumental 3; and the same similarity exists between the 3 of the Old-Hindi objective and the 3 of the Modern-Hindi instrumental; and so also, while is the sign of the dative-objective in Gujarati, it is the sign of the instrumental in Marathi. From those considerations it would seem to result that the two forms are identical in origin, and have been confounded with one another by the vulgar. For, as regards Hindi and Panjabi, certainly my own experience is, that the objective and impersonal constructions are never properly understood by the unlearned, and in the rustic dialects of the Eastern-Hindi area are more usually omitted altogether, and the direct or subjective construction employed.

It would be out of place here to go into more detail on a question of syntax; but it may be noticed that the participial form will, with its variant will, which is almost if not quite proved to be the origin of the cuse-affix of, is often used with a very wide range of meanings, and with great laxity of application,—as is natural from its meaning, which may, without violence, be diverted to many uses. Thus in Old-Bengali it is used in the sense of "on account of," "for," as—

### कि नागि सुंदरि बदन द्वापयसि ॥ हरन चेतन भीर ॥—Bidyapati in Pad.

"For what, O fair one, dost cover thy face?
It has ravished my senson."

It is, however, necessary to inform the reader, that the theory above stated is not the generally received one; or, as these languages have never yet been studied scientifically, it would be more accurate to say that it is not the theory held by the few scholars who have looked into the question. Trumpp probably means his remark upon p. 113 to be taken as a mere obiter dictum, and it seems not to have occurred to him that there were serious objections to his derivation. He and others state that the affix it, with its variants, is derived from the case-ending The instrumental in Sanskrit ends in ens in of the Sanakrit. the case of a-stems; and down to a late stage of classical Prakrit, this ending is preserved, and occurs oven in Chand in Gatha massages, and, as stated in 5 48, survives in Marathi as t. where the final w has been weakened to anuswara. In Gujarati, also, the e of the instrumental has been mentioned in the abovequoted section as a quasi-synthetical termination; but it will be observed that this ena loses its a, and that we cannot in any way get ने out of it, unless we suppose a termination नेन to start with, which does not exist. In general, the modern languages, throwing aside the complications of the various Sanskrit inflactions, adopt those of the a-stem only, and the few traces of the synthetic system that still survive are, without exception, to be referred to that stom. We should hardly be justified in looking to the terminations of any other stem for the origin of modern. forms; nor in this case would it much belp us if we did : for, in all but the a-stem, the instrumental termination is wi; and although in mase, or neuter stems ending with a vowel an w is inserted, making the whole termination at, yet this a is regarded by Bopp, i. § 158, as euphonic only, and not an

organic portion of the word. Even from W, however, we could not get the anuswara of W; and if this affix were really, as the theory assumes, a relic of an old synthetical ease-ending, we should certainly find it in full force from the earliest times; whereas, on the contrary, the modern origin of W as an instrumental with the objective construction, has struck many scholars, and is, I believe, now generally admitted. Some instances may here be adduced of this construction in the older poets to show that they did not use an affix W or W as an instrumental.

Chand uses the direct or subjective construction even with the preterite of transitive verbs; thus—

# बुह बार बुझयी राज ॥ दुव दियों न उतर काल ॥—Pr. ॥ 1. 40.

"Ten times the King asked,

The Brahmin gave no answer in the matter."

-where, in modern classical Hindi, we should have राजा ने पूछा and दिवा ने दिया।

Where the subject is a pronoun, it is often put in the oblique crude form, and the verb agrees with the object, as—

# तिन रचा कोनी सु दुव ॥—1, 136.

"He protected the Brahmina."

Here तिल is plural oblique, and कीली the old form of the preterite fem. of करना, agreeing with रचा: again—

# जिहि रचे सुरग भू सत्त पाताल ॥—і. ।।.

"Who made heaven, earth, the seven hells."

The various nouns agree with va. which is neuter plural; while fafe, the subject, is oblique singular. In the passage above quoted, i. 49, occur two lines close to each other, each with a different construction—

#### विहि हत्वी अप्य भी तात गर ॥

"He who killed the smake on my father's neck."

and in the next line but one ओ इत्यो अध्य. In the first we have the agent in the oblique जिद्दि; in the second it is in the nominative जो-

# मुद चाव चंद्रेल मु सीनी ॥ यह परिमाल लिखी करि दीनी ॥—xxi. 124.

"Good speed the Chandel made,

(Saying) 'Parimal hath written this," he gave it into his hand."

Here the agent is in the nom. singular, although the verbs and and and, being both preterites of transitive verbs, would in Modern-Hindi require the objective construction.

Coming down to later times, we find Kabir employing the oblique construction without w.

## जिन्ह कलिमा कलि माह पढाया॥ जुद्रत पोजि तिन्हें नहि पाया॥—Ramaini, 38.

"He who taught the Kalama in the Kali Yug. Having searched, did not find the power (of Allah)."

बिन्ह and तिन्हें are both plural oblique; but the construction is irregular, as the Arabic words کلم kalama and تدرت kalama and تدرت kalama and we should expect पढाई and पाई.

Perhaps it would be unfair to expect such a refinement from the weaver-sage, who wrote his language as he found it, without troubling himself much about the words he used. The fact that Kabir was a man of the people, and not a pandit, gives us great confidence in his writings as evidence for the way the ordinary folk of those days talked; and this confidence would be greater could we be sure that his writings had not been tampered with by meddling scribes. Again, he uses the direct construction in

#### मिंस कागद कूयो नहीं कलम गहीं नहि हाय। चारों अस माहाता जिहि कविर जनायों नाय।

-Sabbi 183

"Kabir touched not ink or paper, he took not pen in hand; He made known the lord to whom is glory in the four ages."

Here afar is nominative to the three transitive preterites are "touched," and "took," and anial "made known;" and with regard to the first verb, its objects are afar, which is fem., and ana (3.25), which is mase; the second verb has for its object and (3.5), which for some reason is always fem. in Hindi, and the verb is fem. also, and thus agrees with its object. It must be observed, however, that the word Kabir would, if treated as a Hindi word, have the same form in the oblique as in the nominative, and we may thus fairly regard it as oblique in this place. The verbs would then all regularly agree with their objects, as in the Karmani construction; in which case, if Kabir had known of the modern use of as a sign of the instrumental, he would doubtless have used it. Another—

### में रोयो सब जगत को मोको रोवें न कोड़॥ मो को रोवें सो जना जो सब्द विवेकी होइ॥

-Sakhi 176

"I have wept for all the world, no one weeps for me, That man weeps for me who contemplates the word."

Here \$\frac{1}{2}\$, though used in Modern-Hindi as a nominative, has not yet lost its true force as instrumental of the first personal pronoun, of which \$\frac{1}{2}\$ (\neq \mathrm{2} \mathrm{2}) is the true nominative.

The use of ₹ as an instrumental is quite unknown to Behari Lal, in whose Sataāi it does not occur once. Tulsi Das is equally ignorant of it, as—

#### जब रघुनाथ समर रिपु जीते॥

"When Raghunath conquered his enemies in battle."—Armys-k. 265.
Without prolonging this inquiry by adducing any more

examples, it may be said, as a general deduction from the practice of the Old-Hindi poets, that they are ignorant of the use of \$\eta\$ as an instrumental case-affix, and use the objective construction, as a rule, with the oblique form of the noun, indicated, where there is any oblique form, by the affix e; and that in this respect Sindhi, Gujarati, and, as far as we know anything about it, Old-Panjahi, agree with Hindi, while one at least of the Marathi forms of this case is a relic of the Sanskrit instrumental. It would thus appear that, on the decay of the synthetical system, and the fusion of all the case-endings thereof into the one oblique form of the analytical system, no trace of the instrumental as a separate case remained, and its place was supplied by the objective for many centuries. A partial revival of this case took place at a later period, probably about the reign of Shah Jahan, when the form W, hitherto used for the dative, began gradually to be extended to the noun when used as the subject of a transitive verb in the past tense, and thus deame in High-Hindi to be used as an instrumental.

The reason for fixing the sixteenth and seventeenth centuries as the period when this innovation occurred is, that, as my learned friend Professor Blochmann has shown, it was about that time that the general admission of Hindus to offices under the Empire began to bear fruit in the Persianized form of Hindi which we call Urdu; and this new phase of the language was based, to a great extent, on the dialect of Hindi spoken in the provinces adjacent to the Court, in which the form was in use as a dative.

Marathi supplies yet another argument in favour of the theory now under discussion. In that language the instru-

I wish to take this apportunity of paying my tribute of respect to this profound scholar, whose knowledge of all that pertains to the Court and Government of the brilliant Mughal dynasty of India is singularly uninute and accurate, and whose splanded edition and translation of the "Ain Akberf" is the most valuable contribution to our information on this subject that has yet appeared, displaying an indiatry, depth of research, and range of knowledge, worthy of the highest admiration.

mental in \$\varphi\$, which has been shown to be a relic of the Sanskrit. UM, is felt to be too weak by itself to express the instrumental relation proper, as distinguished from the merely constructive instrumental; and where direct instrumentality is required to be expressed, we find a case-affix added; thus, "by means of a weapon," is ned used, where ned alone is not felt to be explicit enough. On the other hand, w, so far from being felt to be an old half-abraded synthetical case-ending, is recognized as a distinct word, and has even yet hardly taken its place as a case-affix, but is often used as a postposition attached to the genitive case: thus we have such forms as आचा न="by him," where will is genitive musculine. It must be borne in mind that there are three grades of formative additions to a noun in these languages. First, and oldest, those affixes which are remains of the Sanskrit case-endings and are fully and completely incorporated with the stem and inseparable from it. Second, and next in point of time, those affixes which have been adopted to supply the place of case-endings when these latter had become so much abraded as no longer to mark case-relations with sufficient accuracy, and which are not integral portions of the stem-word, but are attached to its oblique form. Third, and latest, those adverbs, particles, and postpositions which are recognized as independent words, and are attached to the stemword after it has already received its case-affix. It will be seen that the degree of coherence of these three grades is exactly in proportion to their antiquity. Consequently, when we find in the third of these categories, we cannot admit it to be a relie of the synthetical system, because, if it were, it would be in the first category.

Marathi has plural forms for all its methods of forming the instrumental: thus-

Singular t has pl. & and 質.
.. 有 .. .. 可
... 1 ... 1

In this particular, popular usage scens to have extended to all three affixes a plural which was originally appropriate only to one; and the use of iff in the singular is parallel to that of the ablative form 37, which, as shown in § 51, has been extended to the singular from being originally plural only: for wi must be taken to be originally a plural also. The form at is a synthetical relie, being merely a lengthening of the Prakrit fe. Sanskr. far (Imssen, p. 310); Iff is more correctly written all. and is, I think, another instance of the connexion between the instrumental and the dative. Such a word as देवाशी, or देवासी. "by a god," would correctly be divided देवास + दें (for हों), and not देवा + भीं. Hoernle has shown (J. A. S. B. vol. xhii. p. 61) that the form Zaierzi, used as a dative in Marathi poetry, has similarly been treated as though it were देवा + साठी, which is erroneous, as there is no such word as WIST. The word should be divided देवाम + आडीं; the latter word being a Prakrit form of we "en account of." In these two enses we have a construction exactly parallel to that of missi s above, where the affixes are only in the third degree of cohesion, and are attached to the genitive of the noun: for, as explained above, § 52, देवास. though now used as a dative, is really देवसा = Skr. देवसा. Lastly, for the confusion still existing between the two cases may be cited the curious construction still common in Panjabi in such phrases as उस ने आउवा सा = "he was to have come," literally "by or to him to come it was"="illi veniendum erat," or "ah illo veniendum erat," where we may call उस ने a dative or an instrumental, as we please. Native grammarians call it the latter.

The above considerations leave no doubt in my own mind of the truth of the theory that the forms of the instrumental caseaffix now in use are originally datives which have been transferred to the instrumental. Other similar cases of the affixes of one case having passed over to another will be met with as we go through the remaining affixes. § 58. THE ARLATIVE.—The terminations of this case in Sindhi and Marathi have already been shown to be remains of old synthetic case-endings. Marathi has no other method of expressing the sense of "from;" but it, like all the other languages, uses the oblique form of the noun, together with a long string of affixes, or rather postpositions, to express meanings which it has been customary with grammarians roughly to class together under the head of ablative.

Strictly speaking, however, the ablative is that case which expresses procession from, or, as it is called by Sanskrit grammarians, autzia; and I shall here therefore only astice those affixes which convey the meaning "from." These are—

Gujarati . . थी. Oriya . . . . इ.

Bengali has no form for the ablative, but uses a postposition gra, which has been explained above, § 51. The origin of the form appears to be the Skr. adverbial ablative ag, as in quant "from the village," in Pr. at, where the a has been softened through a to c. In Chand it is often written a, as—

#### ता के कुल ते उपानी ॥

"From his race sprung."-i. 164.

#### तुम यही कर जीव ते वध ।

"Say ye (and) I make him slain from life."—i. 178. (i.e. give the word and I kill him),

I think the anuswars here is merely an inorganic addition, as it so frequently is. Concerning the origin of \$\forall 1\$, there is much obscurity. No scholar, as far as I know, has as yet thrown any light on it. The most probable supposition is, that it is of the same origin as \$\frac{1}{10}\$, but with the particle \$\frac{1}{10}\$ added, so that \$\frac{1}{10}\$ would stand for \$\frac{1}{10}\$; the vowel being lengthened. This appears to be Vans Taylor's idea (Gujarati Grammar, p. 64); but he seems also to think the form may have arisen from a fusion the two forms of the Prakrit ablative in \$\frac{1}{10}\$, \$\frac{1}{10}\$, and the two forms of the Prakrit ablative in \$\frac{1}{10}\$, and the which is possible, but not probable, as \$\frac{1}{10}\$ is too old a for having passed into \$\frac{1}{10}\$, and \$\frac{1}{10}\$ before the period of the origin of Gujarati.

For the Sindhi 電t, etc., Trumpp offers no satisfactory account, merely remarking that it is allied to the objective sign 毫 (京元), but with the termination of the ablative 電, 電, 電, etc., added. More will be said on this point when considering the postpositions.

The Oriya appears in this form in the earliest documents we possess, and a fuller form 31% is common in modern times. It will not, I think, be contested that we have here the Prakrit ablative in and; so that the forms would be Skr. Applied, Pr. 31413, 31413, 31413.

The Hindi affix \$\mathbb{R}\$, usually applied to the ablative in modern writings, does not really mean "from," but "with," and comes under the head of postpositions; but as it is now used as a case-affix,—that is, with the oblique form of the noun, and not, as pure postpositions are, attached to the genitive or other case,—it will be better to consider it here. \$\mathbb{R}\$ is softened from an older form \$\mathbb{R}\$1, still used constantly in the rustic dialects of Hindi, and this leads us back to the full form \$\mathbb{R}\mathbb{R}\$, which is the Sanskrit adverb \$\mathbb{R}\mathbb{R}\$ "with." Chand uses it after verbs of speaking, just as \$\mathbb{R}\$ is used in Modern-Hindi—

### वह दत प्रिथिराज सम ॥

"Quoth the messenger to Pritkiraj."-xii. 16.

#### कहें कंति सम कंत॥

"Quoth the wife to the husband."-i. 7.

in which latter instance it precedes the noun to which it belongs:

Sindhi has forms wi, and w: Gujarati wor w, used in poetry in the general sense of "with," though in some grammars erroneously called a locative, probably also belongs to this group; and in Old-Hindi we meet with an intermediate form www, to which correspond the Sindhi forms will and www. In Old-Bengali we meet with www. which, however, is probably for www. the form used in the modern language. Thus Chandi Das (a.n. 1460) has—

यमुनार भूजे कद्वेर सूचे मिनिल आसेर सने 1 — Pad. 1307, 26. "On the banks of Yamuna, beneath the Kadamba tree, she met with Shyama."

und Kasi Das (Mahabharat 415, 5, 6):

### बार सने वने यह करे तिन अने ॥

"With whom in the forest fight the three men?"

Tuisi Dās uses सच in his Ramayan frequently -

### तेहि सन याच्चवनवा पनि पावा ॥

"With him Yajnavalkya afterwards found (it)."—Bala-kand. 14.

### में पुनि निज मुद्द सन सुनि॥

"I afterwards having heard it with my own guru."-il.

#### चित्रटा सन योजी कर जारी॥

"She spake with Trijata, clasping her hands together."

—Sunder-kand, 200.

8 59. The Generive.—In all the seven languages, and in most of the subordinate dialects, the system that prevails for this case is to add to the oblique form particles which vary their terminations so as to agree with the governing noun. In other words, the genitive case-affix is adjectival, and agrees with the governing noun just as an adjective would, so that, as has been frequently remarked, the construction is not that of the Latin patric equals, but that of paternus equals. Bengali and Oriya having lost all gender and all means of marking the oblique form, have also rejected as uscless the adjectival form of the

genitive; but it will be shown that the affixes which they use are closely allied to those used in some of the other languages. The forms are as follows:

Hindi			- foll-	Marathi.	7	10 2005	chil
Panjahi .	19		dil.	Bengali.	12	1235 18	FF.
Sindhi .	2	ĸ.	+ jo.	Oriya	¥1	F 24 14	ar.
Gojarati .	12	×	- 4m				

The first five languages inflect this form. Thus Hindi has जा, जे, जो; Panjabi द्रा, दे, दी, दिखा; and so with the others. Bengali and Oriya remain unchanged; and omitting them for the present, it will be seen that the principle of making the genitive case of the noun into an adjective runs through all the other five. It also prevails in the allied dialects. Thus Marwari has रो, रे, etc.; Mewari को; the Konkani dialect of Marathi जो, जो, जे, etc., as well as जो, जो, जे, रे, संह, संज, etc.

The genitive is the most difficult of all the cases to account for; and, as there has lately been considerable discussion about it between high authorities, one cannot but approach the knotty subject with some trepidation, taking as our starting-point the modern Hindi forms का, के, की. When the governing noun is mase, singular nominative, the genitive takes the affix का, as बापका घोडा "the horse of the father." The affix की is used when the governing noun is feminine, no matter what be its number or case, as बाप की घोडी "the mare of the father:" बाप की घोडीयां "the father's mares." When the governing noun is mascaline, but not in the nominative singular, के is used, as बाप के घोडे को मारा "he beat the father's horse." Hindi has only these three forms, and the reason of this is, that its adjective is not inflected any more than this (see § 56).

It may next be noticed that there is evidence to show that a letter T has dropped out of all these forms.

Coulss-Rivard, Grammatica da lingua Concani (Gen., 1859), p. 386.

The Bhojpuri, a widely-spoken rustic dialect of Bihar in the eastern Hindi area, has in its pronoun of the third person the genitive affixes \*\*(1, \*\*), though I have never heard \*\*(1). With this agrees the language of the Chingunas or Gipsies of Turkey, whose genitive is formed by koro, which does not change for gender or number, though the closely allied adjective in koro, which Paspati (Tchingianés, p. 53) distinguishes from the genitive, does. Thus, Balameskoro manush, "a Greek man," Balameskori gaji, "a Greek woman."

The Marwari dialect, as spoken in the present day, uses, as mentioned above, the forms रो, रे, री: thus आयो में रामगढ रो बाखो राजारों फोताहार "Here come I the merchant of Ramgarh, the Raja's treasurer;" फोताहारी करी राजरी जीवुं प्रवी पारे "I hold the treasurership of the kingdom, from which I have acquired dignity."!

Nepali has  $\overline{\mathfrak{A}} = H$ .  $\overline{\mathfrak{A}}$ ;  $\overline{\mathfrak{A}} = H$ .  $\overline{\mathfrak{A}}$ ; and  $\overline{\mathfrak{A}} = H$ .  $\overline{\mathfrak{A}}$ . Nepali having set up as a distinct language on the formation of the Hindu kingdom of Kathmando in A.D. 1322, we should expect to find it perpetuating the Hindi of the date when it separated from the parent stock, and we are thus led to conclude that, as early as the fourteenth century, the  $\mathfrak{T}$  had dropped out of many rastic dialects as regards the noun; while as regards the pronoun, it is retained in all of them to the present day; and, with the exception of M. and S., the genitive of all the personal pronouns in all the languages of this group is formed by an affix whose typical letter is  $\mathfrak{T}$ .

One step further back from modern times takes us to our only authorities for mediaval Hindi—the poets. These eccentric gentlemen are very fond of omitting case-affixes altogether, and stringing in one line a number of nouns in their crude form, leaving the reader to make sense of them as best he may. I am not here alluding to Chand, but to writers far more modern than he, as Tulsi Das and Bihari Lal. When, however, they do

Marwari Khyilis, p. 3, ad. by Rev. J. Robson, Bonwe, 1888.

condescend to use case-affixes, they use several separate sets of forms.

First, and commonest, are the forms now in modern use:

\*\*\*Title \*

# की जारा नगर निमिय माही

एक किमीयण की घर माही [-Sandar-kand, 305.

"He burnt the city in a moment, Only not the bouse of Vibhishan."

की जिल्ह की कीन्हेंसि शमित वडाई ⊩-#-

"Of whom he has made unlimited boasting."

के मुनज विभीषण प्रभु के रीती a -46. 298. "Hear, O Vibhlahan, the lord's custom."

In this last instance रोती, though feminine, has the masculine oblique form of the genitive; and this would seem to show that was used with the oblique of both genders, for रोती is here the objective, though without the case-sign.

A few instances may be taken from the Bhaktamāla of Nābhaju (circa a.r. 1600, the ţîkā is a little later):—

### आये वामदेव पाँछे पूछि नामदेव जूसी दूध की प्रसंग खित रंग भर भाविये ॥—Bb. 133, 1, tlka.

"Came Vamdeb afterwards, he asked Namdevjü, 'Tell me in full the very pleasant account of the milk."

### कोक काव नवरस सरस शुंगार को सागर ॥

"A new zest in amorous poetry, an ocean of impassioned love."

### नरसिंघ को अनुकरण होई हिरनाकुस मार्थी ॥

"In imitation of Narsingha, he smote Hiranakus (Hiranyahasipu)."

—45, 49, add.

Extremely common in Tulsi Das is the form we; this is noticeable because affording a connexion with the Bhojpuri and the Gipsy kore. It is not declinable, and does not therefore make the genitive into an adjective. Instances abound, the following are a few:—

#### नापि कर वचन संप्रेम सुनि॥

"Hearing the friendly speech of the mankey."-Sundar-kand. 300.

#### सब कर याजु सुक्रत फल बीता॥

"To-day the fruit of the good deeds of all has passed away." -Ay.-k. 343.

#### वेगि हरझ मुद्र कर प्राणा।

"Quickly take away (this) fool's life."-Sundar-k. 304.

In some copies a feminine form and occurs; but this is written at in others.

#### कपि करि समता पृंक् पर ॥

"The pride of a monkey is in his tail."-Sundar-k. 304.

#### अवग सुनत शठता करि वाणी।

"Hearing with his cars the word of treathery,"-4. 309.

Kabir uses this form-

### नहि चकु होति दिवस चव राती ॥ ताकर कड़क बीन कल जाती ॥

"There was there no day nor night,

Of him (i.e. the Creator) tell what is the rare and easte?"

—Ram. vi. 5.

It is not, however, frequent in his poems; and, when it occurs, is chiefly used with the pronouns, as in the lines just quoted.

At this point comes in Bengali with its genitive in ut, which, like Tulsi Das's genitive in ut, does not change for gender or case. In Old-Bengali this case takes the affix ut, which still survives in certain adjectivally used forms; but, in accordance with modern Bengali pronunciation, now takes long a, and becomes ut. Thus they say, uture "of to-day," attempt "of to-marrow," or "yesterday," in such phrases as

"your letter of to-day has arrived," "the affair of yesterday;" also natate. varate "of that place," "of this place." The Oriva genitive in wy also belongs to this category. In the singular it has lost its 4, because in Oriva the final a of stems ending in that letter is preserved, so that we must read ut ghara, not, as in H. or P., ghar. From this it results that when the affix at was added, the a stood alone between two vowels, and was, according to the general rule, elided. It ought to have thus produced gharu+ar=gharar; but the tendency of Oriva is to shortening unaccented vowels, and, whatever may have been the place of incidence of the accent in moient times, in the present day it is certainly on the stem-syllable in gharar. Consequently, instead of gharar, we get gharar. In Bengali the same thing occurred, and the present form of the genitive in er is, in all probability, another exemplification of the often-remarked tendency of this language to corrupt d into e, This view is supported by the fact that, in many cases where custom had previously led to the rejection of the final s of the stem, the genitive even in Bengali is formed by ar, as in Oriya. If further confirmation were needed of this origin of the T genitive, it would be found in the Oriya plural, where the a is still preserved. Oriya, as above noted, § 43, adds to the stem the word ATH, to form the plural. This word takes in the nom, the form माने for animate, and मान for inanimate objects; and in the oblique मान्न, which is probably for मान्ति, like the Old-Hindi plural. Adding to my the genitive form at, we get the modern Oriya genitive मानक्र, wherein the न has been preserved, quite according to rule, by being incorporated with the preceding nasal. Bidyapati sings-

जुलकासिनी छिनु कुलटा भेगेनु ताखर यचन सीभार ।-Pad. 984, 5.

"I was a virtuous woman, I have become unchaste through delighting in his words."

In his poetry, however, as in Kabir's, this form is more

frequently met with in the pronouns; in the genitive of nouns he generally drops the ₹, and uses only ₹: as—

### सुजनक प्रीति यापाण सम रेहा ॥--Pad. 985, 2.

"The love of a good man is like a line (engraved on) stone."

### प्रेमक गुण कहन सब कीड् ॥—Pad.

"Every one will say (it is) the quality of love."

#### येक्ने बाइत मृगानव स्त #-Pad. 109, 6.

"It increases like the fibres of the lotus."

To be classed together with these forms is, I apprehend, the Marathi affix \$\(\frac{1}{2}\), denoting "a resident of," as in fausiate "a man of Chipiun." Here also I would place the Marwari \$\(\frac{1}{2}\), where the initial \$\frac{1}{2}\$ has been rejected, and the still further corrupted Mewari \$\(\frac{1}{2}\), and Konkani \$\(\frac{1}{2}\).

Passing on from at and its variations, we must come to a fuller form at. This was first pointed out as a genitive by Hoerale in his articles in the Journ. As. Soc. B., and I have since found additional confirmation of his view from other instances. The two passages which were first noticed are in Chand.

### जिया नद नीमान फाँचे सु फेरी ॥ भिदी दिष्टि मीं दिष्टि चाजवान केरी ॥—xxi. 29, 9.

"The kettle-drum made a noise, the armies wheeled, The sight of the Chihnvan was lest from view."

That is, the two armies lost sight of each other from the dust they raised. The second passage is very obscure, and the rendering is tentative only; there is, however, no doubt about the genitive.

दौरे यज अंधं चाजवान केरी ॥ करीयं गिरदनं चिहीं चक्क फेरी ॥—xx. 141, 7.

"B)indly ran the elephant of the Châhuvân;
Making a circuit, he surrounded (the enemy) on all four sides."

There are other passages also where this form occurs. In fact, it is used whenever a rhyme is wanted for the preterite of

फेर्ना "to turn." Kabir, however, uses it in the middle of a

### मानस केरि खचाइ या मति कोई पैठे घाइ॥ कुद पेते चरत है बाध सदहरा गाइ॥—Sakhi 153.

"The selecty of human beings, into that let no one hastily plunge; In one field feed the tiger, the ass, and the cow."

### तामस केरे तीन गुन भीर नेह तह वास ॥ एके दारी तीनि फन मांटा क्ष क्यास ॥—Sakhi 142

"Of ignorance are three qualities, the bee (i.e. life) has there taken up his abode;

On one branch three fruits, the brinjal, sugar-cane, and cotton."

### सावन केरा सेघरा बुंद परा श्वसमान ॥ सव दुनिया विणाव भई गुरून साम्यो कान ॥—Sakhi 77...

"(As from) the clouds of Sravan drops full from the sky,
All the world has become Vaishnava, giving our to the gurus."

(Here असमान= آسمان, दुनिया=کُنيا). Tulsi Dàs also knows this affix, thus—

### भये बड़त दिन ऋति खबसेरी ॥ सन्न प्रतीति भेट प्रिय केरी ॥—Ayodby#-k. 53.

"For many days there was great expectation, Omens and certainty of a meeting with the friend."

### मुनि चस उक्ति पवन सुत केरी ॥ विष्टेस रघुपति कपि तन हेरी ॥—Laukā-k. 6.

"Hearing this speech of the sun of the wind, Smiles Raghupati looking at the monkey's body."

### धूबा देखि खर दूपगा केरा 1-Arupya-k. 265.

"Seeing the smoke of (the bodies of) Kharn and Dushana."

The form 307, with its changes for gender and case, is also

<sup>&</sup>lt;sup>1</sup> This is one of Kabir's obscure didactic utinesses. He means that ignorance, or rather the condition of unassisted human nature, has the three qualities of satter, expect, and toward, in which life, compared to a bee among flowers, is such. It is, he says, as if one branch should beer such different products as those mantioned.

in use in Old-Gujarati, and the range of forms is fuller than in Hindi; thus we have—

With a n. sing. 南社 海社 海社 海社 ... n. pl. 南社 bl. 南社 ... att and 南社 ...

Illustrations are-

#### चंपक केरी बेटडो । में राखों के घेर ।

Samul Das, Padmavati, 64.1

"I have kept at home the son of Champak."

### अकम होय हजूरी करो शीपी नार्ध वाधी सायर ॥

"Let there be an order of Your Majosty, I will suck the sen dry,"

-id. Anyadarishidd in Kiryo-d. 1, 23.

### बाह्रवी केरा तरंग तजीने तटमां बाद क्य खादे रे

"Having left the waves of Ganges, he goes on to the bank and drinks from a well."

-Norsingh Mehate in Edops-d. ii. 4.

It is a well-known and frequently used affix in Gujarati.

To complete the range of illustrations, I may add here a remark which was accidentally omitted from its right place a page or two back, that Bidyapati's genitive in a, formed by omitting the  $\tau$  of  $a\tau$ , is also found in Old-Hindi. Thus, Tulsi Das has—

#### पित आयस सब धरम क टीका I-Ay.-k. 334.

"(To obey) a father's command is the crown of virtue."

And it occurs in Chand :-

#### इरि सु उत्तरे क्लिक सहि॥

"Hari can save in an instant."-i. 60.

In this place 兩種 is = 兩國, and is used in the third grade of cohesion with the genitive of the governed norm, so that f要可要 is a genitive (f要可申申明), and 兩 is shortened from 兩天 or 每天7.

From Locky's Gujaroti Grammar, p. 250.

The various facts that have been adduced have brought us up to the edge of the gap of the dark ages; and, before leaving terra firms for the region of analogy and the cloudland of inference, it may be as well to sum up what we have gained.

Hindi forms its genitive by affixes which produce an adjectival construction; these are का. के. की. Of these का is written की in Nepali, and in many rustic dialects, also in mediaval poetry.

Bhojpuri has a pronominal genitive in att, at. Marwari has the time att, which is doubtful. Origin has at in the genitive plumi, and at in that of the singular, which latter is due, as is also the Marwari the to loss of the at. Bengali had at in pronouns, and has att still in certain adjectival formations; and its present genitive at is formed from at by loss of and softening of the d (resulting from the coalition of the final a of the stem with the initial a of the termination) into a more me. The gipsies have preserved the and the toth in their genitive kere, which, when used as an adjective, has a feminine keri.

Old-Hindi and Gujarati have a fuller form of this genitive affix—करा, करी, करे.

Beyond these facts, there is, as far as we know, nothing further to be adduced; and the question now is, what is the origin of these forms? The form to be found in one of those scraps of Apabhransa saws which Sastri Vrajlal has quoted in his admirable little work. He unfortunately does not give the author's name, and gives the date as Samvat 1551 (a.p. 1495), which is very modern for Apabhransa; but the language of the lines is older than this date:—

### कासी करो जाफरो दासी करो नेह। कंवन करी वंधणो झटिक देखाडर केह।

"Constitution at eighty-six, falling in love with one's female slave, Wrapping encode in a blanket, show that death is near."

This might pass for Old-Hindi or Old-Gujarati; and it is noteworthy that the language is precisely identical with that which Hemachandra writes about as a Prakrit. It may, therefore, be permitted to us to regard the form at as one which ascends into the Prakrit stage, or that of decaying but still existent synthetical forms, and it is consequently a form which has not yet become a mere affix, but still retains something of the nature of an independent word, and; as such, has a meaning of its own. We shall see, as we go further back in point of time, that in a slightly earlier age this word is capable of being used alone as an integral constituent portion of a sentence.

There has lately been a controversy between Hoernle and Pischel on this very subject; and in a work like this, which professes to lay before the reader such deductions as the author has been able to make from his own observation, and such facts as are generally admitted by scholars, it would be out of place to enter into a lengthened argument upon questions which are still subjudice. After reading and testing as far as I am able the arguments of both sides, the conclusion that I have come to in my own mind is that Hoernle is right, and that the objections of Pischel refer rather to details than to the general argument. The reader may judge for himself, either from the original articles (J. A. S. B., pt. i. p. 124, 1872; Indian Antiquary, vol. ii. pp. 121, 210, 368), or from the following brief, but I trust accurate, abstract of the arguments.

The Prakrits have a word kera, which is used in the plays in the sense of "done by," "connected with," "belonging to," and the like. It is to this word that the genitival form and is referred by the writers above mentioned. It also occurs as keraka. Hoerale derives it from the Skr. past participle gra; Pischel, following Lassen and Weber, derives it from karya. Hoerale's process is as follows: gra becomes in Prakrit aftal, just as ya becomes aftal and ya changes to utal; then the a drops out according to rule, leaving utal, which is the same word under a slightly different method of spelling as Chand's util, a form in use all through medieval Hindi.

करियों or क्यों makes करों just as naturally as बाख्य makes west through western (see Vol. I. p. 135). Pischel seems to mistake Hoernle's meaning, and to labour under the disadvantage of knowing nothing of the modern languages. A question like this is not to be settled, like a matter of Greek or Latin scholarship, merely by collating texts of written works. He urges that keraka is far too modern to have undergone "so vast and rapid" a change as that into Bengali er. But, unless the whole of this work which I am engaged on is wrong, the most striking feature of the seven languages is precisely the "vast and rapid" change which they have undergone; and, in this particular instance, a change that took fifteen centuries to effect is hardly too rapid. He relies on Lassen (p. 118), who, however, admits that his reason for doubting the derivation of कर् from क्रम is morely the absence of an g which could form प in the first syllable by epenthesis. Hoerale has shown how this might be, and has proved the existence of intermediate forms करितो and करियो. The derivation from कार्य is a sort of pis aller, a casual thought which appears to have occurred to Lassen when he was bunting for an analogy to dicharya=achchhera. It does not seem to have struck him or Pischel that the meaning of karyam will not in any way produce a genitive, while that of krita will. Krita means "done;" and to take as an instance the line of Tulsi Das quoted above, अपि कर वचन = विपक्त वचन "the speech made by the monkey," is a phrase which would easily glide into "the speech of the monkey," while the phrase अधिकार्थं वच्चं would require to have its meaning violently. wrenched before it could be got to mean anything of the kind. I cannot perceive the drift of Pischel's objection founded on the fact that kerake is always inflected. Of course it is, and so is its descendant Gujarati केरो, केरो, etc.; and it is this very quality of being inflected that makes it suitable for an adjectival genitive affix. It is further urged that in the later Prakrit dialects keraka becomes kelaka. This does not concurn us, because the later

written Prakrits are as artificial as Sanskrit itself, and probably were utterly unlike the spoken language.

It may then, as a conclusion, be safely stated that Skr. BRU becomes in Pr. aftwi. then att and attal, from which we get attal and att., and that from this, shortened into att, comes the Mod.-Hindi at; while from at, rejecting the final vowel as useless, in the two languages which have disponsed with gender and case, the Bengali forms at and at and the Orive at and at are derived. It is possible that the Mewari and Konkani at may be similarly derived from and; but I prefer to regard them as modifications of an original them as we have in Marwari.

Gujarati has for its genitive affix a series नी, नी, नुं, etc. The early form of this affix, which is found also in Apabhransa, is तथी, तथी, तथीं, तथीं. Instances are—

#### धान धर हरितशुं अलामति आलस्॥

"Fix thy thoughts an Hari, O thou of little wit, indelent."

—Narsingh Meheta, Küvya-d. il. 1.

(Literally, "grasp the meditation of Hari.")

### सरस गुण हरितणा वे वनो अनुसर्था। तितणा मुक्ता तो जगत वोने।

"The man who has cultivated the excellent virtues of Hari.

The world celebrates his glory."—ib.

### द्वपदी केरि सच्चातमे कारणे दारिका ची धशा एक शासे॥

"On account of the shame of Drupadi, he reshed from Dwarika in a breath."—ib. ii. 5.

In this line both forms of the genitive are used, that with and and that with and. Another instance from the Apabhransa was quoted in § 46. Another is—

#### महाराज लंका तथा। एस भाखे।

"The King of Lanka thus speaks."-ib. i. 16.

Side by side with this affix, the modern affix in wit, etc., occurs:

but this does not prove that it is not a later form of mult. because the poets habitually employ archaic forms side by side with those of their own day, as we have seen in the quotations from the Hindi poets in this Chapter. Nor does the change of ₩ to ₹ present any difficulty, as Gujarati is very lax in this matter, and in common parlance, like Hindi, uses win places where W is etymologically correct.

Bearing in mind that the principle which runs through the genitives of all these languages is to apply to the noun some affix which shall give it an adjectival sense, it will not seem strange that each language should have selected its own affix from the extensive range of adjectival affixes which Sanskrit. offers. In the present instance it is natural to look to the affix तन, in such words as सनातन "porpetual," from सना "always;" प्रतित "ancient," from पुरा "formerly;" चूतन "new," from न "now;" चिरंतन "old," from चिरं "long ago." न is generally written w in the western Prakrits, and thus an becomes in Apabhransa, as we have seen (§ 46), त्रणो. The meaning of तन accords well with that of an adjectival genitive; and it is not strange to see an affix which in the classical language is of restricted use, extended by the vulgar to every noun in their language. Although in Sanskrit this affix forms adjectives out of adverbs of time only, yet in the Gipsy language we find the corresponding affix two extended to adverbs of place; as,

```
anglalatas "farmer," from anglal "before" (Skr. 現石).
                            " | rutti | "night" (Skr. दाचि).
     argutas "firsthorn,"
                            .. argo "former."
     duritag "distant,"
                           " dur "far" (Skr. 4 C).
And even to nouns, as-
```

gavndaa "villager," " gae "village" (Skr. याम, ध. गांव). dakaratno "kingly," " dakar "king."

With clision of t, just as in modern Gujarati,
angarumo "made of coal," " ungdr "coal" (Skr. WETE).
buruso "stony," " bar "stone,"

The affix तना is also in use in some rustic dialects of Hindi, and will probably be found in Chand, though I do not remember to have seen it there.

The Marathi genitive affix WI has been asserted to be derived from the H. at by the change of a into w; but after much searching I am unable to find a single other instance of this change in the whole of this language, and hesitate to believe that so common a word as the genitive affix should be the result of a phonetic change, which is absolutely isolated and unsupported by a single analogous process (see Vol. I. p. 209). It seems rather to have arisen from the Skr. affix 19, meaning "produced in," "sprung from," in such words as द्विशास "southern," पादास "western." Here, again, it is assumed that an affix of restricted application in Sanskrit has obtained a wider use in the valgar language. In old Marathi postry this affix has a lengthened form चिया, चिये, and चेचि; but this additional syllable is merely added to eke out the metre, and is commonly found after other case-affixes also, as in ' हान and हानियां for हन.

Sindhi takes as its affix 氧t, which Trumpp wishes to derive from the Skr. adjectiael affix 囊 through 氧 to 氧, a process for which there is no authority. It will be in analogy to the derivations suggested for the G. 氧 and M. 氧t, to derive this affix also from a Sanskrit adjectival termination, namely 氧 (氧有), in such words as 氧氧, ζω, 氧Ψ, ψΦ, and the like. The only obstacle to this theory is that 氧 is added to the oblique form, whereas, if every substantive had been made into an adjective by the addition of 氧, only the stem would remain; and the same objection applies to the derivation

<sup>1</sup> Miklosich, urbor die mundarten der Zigeuner Europa's, II. 23.

suggested for Marathi \(\mathbf{q}\); thus \(\mathbf{u} \) \(\mathbf{Z} \) \(\mathbf{u} \) and thence \(\mathbf{u} \) \(\mathbf{z} \) \(\mathbf{u} \) and thence \(\mathbf{u} \) \(\mathbf{z} \) \(\mathbf{u} \) and the not \(\mathbf{u} \) \(\mathbf{z} \) \(\mathbf{u} \) \(\mathbf{u} \) and the case-affixes to the oblique form was carelessly extended to the genitive also. As regards Sindhi, however, it is, as an alternative line of investigation to be pursued, worthy of consideration whether we have not here the relative pronoun \(\mathbf{u} \) "who;" thus \(\mathbf{u} \) \(\mathbf{u} \) \(\mathbf{u} \) \(\mathbf{u} \) and "the master of the houses," would be originally, "the master who (is) of the houses,"—the oblique form here doing duty as a genitive, which is exceedingly probable when we remember how large a part the genitive occupies in the formation of the modern oblique.

Sindhi and Kashmiri have a genitive affix, S. #27, K. #2. The modifications of the Kashmiri genitival affix are very eccentric and peculiar, and are given as follows by Elmslie (J. A. S. B., vol. xxxix. p. 101).

```
With singular (Sing. mase. 村文 fem. 村河 (sunr )),
noun (Pl. mase. 村文 fem. 村河 (sunr )),
With plural (Sing. mase. 祖文 fem. 「菅河 (hinz )).
Pl. mase. 「菅石 fem. 「菅河 (hinzah )).
```

Here not only does the affix vary in concord with the governed noun, but it varies with the governing noun also, thus introducing a double series of confusions. Examples are not given in the meagre article from which these forms are taken, and there are contradictions in it which detract from its trustworthiness. Moreover, the author having laid down at the outset a system of transliteration, straightway departs from it; and by giving us also the words in the Persian character instead of the Nagari, he still further misleads the reader. All this is very tantalizing, because the few scraps of information which we have about Kashmiri are just enough to show that it is one of the most interesting and instructive languages of the group, retaining a singularly rich array of archaic words and forms.

There is one peculiarity, however, of which a firm grasp can be taken, namely, the change of initial w into w. This is a well-known feature in Zend and in these Aryan languages which are situated close to the Zend area (see Vol. I. p. 258). This process seems to explain the origin of the Panjabi genitive in दा. दे: दी, etc. In Panjabi, the change of स into स is extremely frequent, and it is in its general features a less archaic language than Kashmiri, so that it is not unreasonable to suppose, that while the latter only suffered # to be weakened to # in the feminine affixes, Panjabi suffered the change to take place in all cases, and we thus postulate an old Panjabi form #21. This form is still used in many rustic forms of Panjabi. It and WET are simply the present participle of the verb "to be," and one often hears सदा जदा = "being," or इंदा जदा, according to the dialect. संदा is the Panjabi version of Pr. सन्ती, Skr. सन्त:, from the root we. One can readily understand how a word meaning "being," when added to the oblique form of a noun, would gradually acquire the sense of a genitive; thus, "the horse being to me," or "which is to me," becomes "my horse," just as in Latin we have the construction "est mihi." The anuswara of the present participle is dropped in Panjabi in many verbs, especially in the more cultivated portions of the country, where the typical or classical form of the language would naturally be developed; thus, while the rude herdsmen of the southern deserts say सार्दा mareada, "beating," the dwellers in towns say सारदा macia. In this way संदा would become get, and that again get, whence by elision of a we get the present genitive form ZT. It is worthy of notice, that this form in 27 seems to be of comparatively late origin, and that in the Granth we more frequently find the genitive affix at, as in Hindi.

§ 60. THE LOCATIVE.—The traces of the synthetic system still

<sup>&</sup>lt;sup>1</sup> Trumpp in J. H. A. S., S.S., vol. v. p. 108.

remaining in this case have been commented upon in § 48: here we have to notice the modern case-affixes used to express a locative meaning. These are as follows:—

The most important group of these endings is that having a for its characteristic, and we are fortunately able to trace the origin of this affix fully back to the earliest times. It is derived from the Sanskrit adverbially used locative and, meaning "in the middle," Chand uses a great variety of progressive forms of this affix, thus showing that even in his time the changes had been completed, and that he was consciously employing archaisms, as he so often does, when he used forms which were older than the latest at. Instances are, dropping the final c, and thus giving and giving giving and giving giving and giving giving

#### षमृत सु खत मध्य वरि ।

"Immortal dwelling among mortals,"-i. 3.

#### इह वीनि वाणी दन मध्य पायी।

"Having said this speech, he came amongst the army."-xxi. 10.

In this fuller form the word retains the fuller meaning "amongst." Next comes the solution of the semivowel into its vowel #fu, and when a long vowel is required #fu.

#### हजार मुतीन परे धर मधि॥

"Thousands three fell on the earth "-xxi 7, 59.

#### जोगिनीय गई रागिनी मणि ॥

"The witch went amongst the queens."- i. 178.

1 Parputi, p. 55. Sor also p. 500.

The natural transition from u+u to u (see Vol. I. p. 326) gives the form usu.

### मुक्षेय परिच मझि विज अधाव ॥

"Fell headling into the bettomless pit."-i. 79.

मुद्देव is here a form of the 3rd person singular preterite for मुद्देश, which would be the Hindi rendering of Skr. मोचित from मोच, and thus means "was set free;" combined with प्रणा = पद्धा "to fall," it means "was let loose falling," i.e. "fell untestrainedly or headlong." The order is here, as sometimes in Chand, and often in Sindhi, reversed, the postposition becoming a preposition.

Connected with this last form are the forms **#i**¶ and **#**₹. with inorganic anuswara, and the former with lengthened vowel. The final short ₹ is rejected, a fate which frequently befalls final short vowels in Hindi.

#### उपवाग मांद्रा चलि गये आप ॥

"They themselves went into the garden."-xxi. 5, 6.

उपनाम is probably a curious termination of उप with Persian

### को राजन जवन धर मन्द्रां ॥

"What king, in what land,"-xxvi. 18.

In the next line we get-

#### परचर उजेन महां॥

"In wealthy Ujain."

परवर = Skr. प्रवृर "abounding in (wealth)." A lengthened or secondary form, सञ्चार, with a quasi-diminutive termination, is also used, but with the more definite meaning, "in the middle of."

#### नर् नारी जन्मा गई। फानुन मास सझार।

"The modesty of men and women has gone, in the middle of the month of Phagun."-xxiii. 1, 4.

-alluding to the indecent songs sung at the Holi festival in that month;-

#### ने पवरि सहर पहांची मद्यार ॥

"Having received the news, she arrived in the middle of the city."
-1 178

#### चारि भाव गये गिर वन मझार॥

"The enemy fled into the middle of the hills and forests."-1, 206.

A step further brings us to the rejection of the organic portion of the aspirate and retention only of the aspiration (Vol. I. p. 263, et seqq.), thus producing the extremely common form #fg.

### कव्यम सहि कसूरी॥ रानी रेहंत नयन ग्रंगारं॥

"Putting muck into lampblack, The queen strenks her eyes for ornament."—i. 20

#### द्यार्यंड महि चरत॥

"Grazing in Jharkhand."-L 61.

It is frequently longthened to sigl and sigl.

### देखति नृपति वसि नींदा माही॥

"Seeing the king sitting in sleep."-i. 191.

### नयी बीर जहन पर्यों धर मांडी।

"The hero Jalhan was smitten, he fell in the field."-xxi. 264.

There is also a corrupt form HTW.

### पिय रन माहिं मरि॥ नारी सती न होय॥

"If the husband dies in battle
(and) the wife does not become a Sati,"—xxi. 175.

From this last form, which is properly ##8, by rejection of the g comes the present ordinary form ##.

### एक सास में नगर बसायी॥

"In one month he colonized a city."-i. 218.

The Sindhi and Gujarati forms are only slight dialectic variations from the Hindi type; as is also the Nepali, which has not the anunasika.

Bengall and Oriya often express the locative by adding the full Sanskrit form will to the genitive, and Oriya oddly gives the locative ending to this word, so that we often hear MISIX Where the last word is the locative of a noun well. Marathi also uses will in the same way, and in poetry the archaic will, as in Tukuram, Abhanga 1887:—

### विश्व हैं विठ्ठल गाहों दुने काही । देखीं तुंही ही तयामात्री ॥

"Vithal is the universe, there is nothing besides, thou also art seen in him."

And again-

### विरंची ने केंक्र ब्रह्मांड सक्छ । तयामाश्री खेळ नागा युक्ति ॥

"Brahma has created the whole universe, in it are his various diversions and skill,"—Abh. 1886.

The most common method of expressing the locative, however, in Marathi, is by adding to the oblique form at, apparently derived from the Skr. adverb unt "within," which in Prakrit becomes unit. This particle is, even in classical Sanskrit, used as an affix, as entert, between the teeth. In Marathi the initial vowel is lost, and the two letters at alone remain. Thus, until me unit "in a house," enter "on an elephant," from unit; and "in honey," from any, with the vowel of the termination lengthened, as is customary in the oblique form.

Of the Bengali & the most probable origin is from the adverbial ablative an, of which notice was taken in a preceding paragraph; and Oriya , which, in its fuller form, is ait, is probably of the same origin,—the two forms, are and ait, having by degrees been restricted to special meanings of the same case, namely the ablative.

§ 61. In addition to the case-affixes above noticed, which are

specially attached to definite cases, there is a very large number of particles which serve to modify the noun, but which cannot have any definite place assigned to them in the narrow range of cases to which the grammarians have bound down the Aryan declension. They fall into two classes, according as they are attached to the crude form of the noun, or to the genitive The classification cannot, however, be carried out very thoroughly, because some of them fall into different categories in different languages. Thus, H. पास "near," (Skr. पास), is attached to the oblique musculine genitive, as घर के पास "near the house," literally "near of the house;" but M. प्रसन, which is the same word as H. qre, is attached to the oblique stem, as uriques. It will be better, therefore, to go through the most commonly used and widely current of these postpositions, without attempting to class them under either of the two heads mentioned above. The distinction is important, as indicating the degree of cohesion to which each particle has attained; and thus enabling the student, in the absence of literature, to form an idea of the comparative antiquity of each of them, and thus to measure, to a certain extent, the rate of progress of those phonetic changes which have given rise to the present modern languages.

§ 62. Of wide use is H. आवे "before," used with a genitive; its older form is आव, still heard in rustic Hindi. Sindhi has आवे and आविश्वो, with oblique genitive in बे, or with ablative in जो. The other languages have—

Panjabi आगे and आगियो. Gujarati अगाउ. Oriya अगेरे ,, अगर. Bengali आगे (vulgo) एसे.

In all these pairs of words we have derivatives from two cases of the Skr. wa. The words in e are locatives from wa.

meaning "in the front;" those in w and c ablatives from want, meaning "from the front;" want becomes Pr. wrang, wrang; and the long d is in Hindi entirely omitted, and in S. and P. seftened to i; while Oriya adds its own locative and ablative case-affixes ? and w.

Similarly, for the corresponding word "behind," the Old-Skr. adjective पद्म (vedic) supplies its locative पद्म (not used in classical Skr.) and its ablative पद्मात्. The words in use are—

H. पाके, पोक् and पाक.

ए. पिक्टि ... पिक्टी-

s. पोए .. प्रश्ना-

G. पके " पक्की, पाक्की-

B. पिके.

0. पक् । पाकु

The nexus \(\mathbb{q}\) regularly becomes \(\mathbb{q}\), and then \(\mathbb{q}\), with a preceding long vowel. H. The presents an anomalous long i, for which it is difficult to account. My theory is, that the same process has taken place as in fagg (Vol. I. p. 307), where the nexus is sundered, and the \(\mathbb{q}\) passes into \(\mathbb{q}\), producing fagg; thus \(\mathbb{q}\) would become \(\mathbb{q}\), or, owing to the tendency to insert infter h between two short vowels (Vol. I. p. 138), \(\mathbb{q}\), and thus \(\mathbb{q}\), which, from imitation of the kindred word \(\mathbb{q}\), has been written with \(\mathbb{q}\). The Sindhi has entirely dropped the nexus, and substituted a labial vowel, which is very anomalous. In every case it will be seen that the terminations are respectively locative, meaning "in the rear," and ablative, meaning "from the rear,"

A third series, meaning "below," is afforded by the same two
cases of the Skr. adj. भीच "low."

H. नीचे and नीच्.

P. नीचे " नीची.

U. नीचे.

B. id.

This series is not so extensively used as the others, as there are two competitors for this meaning: तन, which is the favourite word in B. and O.; and \$3, which has the preference in P. \$3. "below," gat "from below," gat "along the under side of ;" G. इंड "below:" S. इंड "below," इंडा "from below." समे requires no explanation, being a simple Skr. locative, one of those strong plain words which is not susceptible of any phonetic change. To is a curious word, and has undergone considerable change. Its origin is Skr. www. which, in Pali and Prakrit, becomes \$5, by rejection of the initial a, solution of winto \$. and change of the second a to a short c. Although wward, a common Skr, adverb, is generally quoted as the origin of this word, yet it would be more in consonance with the regular course of phonetic change to look to a form wuy; the last element of which would be the root wit (WI), to stand. The P. ggt and S. ggt are, however, regular ablatives; and G. gg is the regular locative, just as the other above quoted words (Weber, Hala, pp. 42, 202.)

Skr. 3uft "apon," gives H. 3ut, and so in all. With loss of initial u, it yields a long string of words, which have arrived at the position of case-affixes, being joined directly to the oblique form; these are, H. ut, uft, u "on:" S. uft, G. ut, O. ut, B. ut. With further softening of u into a, it becomes in M. at, and is closely attached to the noun, being written as one word with it; and so also in Gujarati: not even taking the oblique form of the noun, but the simple stem, as utut "on the house," atax "on a tree."

Skr. स्थाने gives H. ताई and तई, which, from having originally meant "in the place," has grown gradually into an affix meaning "up to," and even simply a sign of the objective = को; so you may say उस को सारो or उस तई मारो "beat him." S. has also ताई and तोई, P. ताई.

From Skr. संमुख, Pr. संमुद्दं and समृद्दं, are derived II. सास्त्र्रें, सान्द्र, समृद्दे, सोद्दे, and सोद्दी; S. सान्द्रीं, सान्द्राणी, and सान्द्रणी P. HIERWAND HIERWAND; G. HEIN, HEIN, HEIN. The M. HAIV, used like the rest in the sense of corum, in front of, face to face, is rather a modern compound from modern materials, H "with," and HIEV! "front," a recent diminutive from HE. To this group may also be attached the Oriya HIH, meaning originally "in front of," then "in the presence of (a king)," and so, ultimately, as a substantive, meaning the court or audience-hall of a king or great man, in which sense it takes the locative sign T, as VINIT HIF FREE HAIL, "he supplicated the king," literally "in the audience of the king." The Hindi writers spell their word in a dozen different ways; but from the terminations of H., as well as the other languages, it is clear, that here also we have the two Skr. cases locative and ablative, as in most of the other postpositions.

Skr. पार्श्व and पार्श्व "near," H. पास, P. पास and पाह "near," पासों and पाही "from near," S. पासे, G. पासे, M. पासी, पासून. Here, again, the locative and ablative.

There are innumerable other postpositions in use in all the languages; they will be found in the dictionary. The point to be observed is the prevalence of forms derived from the Skr. locative and ablative cases, necessitating the placing of the noun to which they are attached in the oblique genitive, or, to speak more clearly, in that form of the genitive affix which it takes when governed by a noun in the singular oblique.

The structure of the modern noun is thus strikingly homogeneous in all the seven languages, as well as in those cognate dialects which have not yet been thoroughly investigated; and which, owing to the insufficiency of trustworthy data for them, it has been found necessary to exclude from the present inquiry. They have all a stem in four forms—the meminatives of the singular and plural, and two obliques for the two numbers. There are also here and there traces, faint and slight, but still quite unmistakeable, of the older synthetical system of the Aryan languages. These traces consist of abraded case-endings,

occasionally removed from the stem, and used as postpositions. Some confusion has crept in-as was natural among generations which had lost the sentiment of synthetical construction-between the various cases, and a form proper to one case has passed over to another, or been extended to all. To supply the distinctness of meaning which the mutilated case-endings no longer afforded, case-affixes, themselves for the most part shortened and simplified remnants of old adjectives, nouns, and participles, have been called in; but though this principle has been introduced into all the languages, the precise words so adopted vary in each case, every language having forms of its own not used by the others. The close relationship of the whole, however, is more fully established by this practice than it would have been had all the languages been in the habit of using precisely the same affixes. Uniformity of principle is a far deeper lying bond and token of esoteric unity than mere surface similarity of individual words: the latter might have been borrowed; the former, being an inborn mental instinct, could not.

The same remark helds good of the still further development of the noun's capabilities of expression, as shown in the post-positions which do not form cases, but are merely attached to the oblique noun. In these there runs throughout the same principle, though its exemplifications are different. The more we penetrate into the secrets of the structure of these languages, the more do they show themselves to be closely allied by the deepest and most fundamental ties,—the same blood runs in the veins of all, and the same fertile Aryan mind has found expression in their rich and varied formations for its activity, wealth of resource, and moluniyance integrals.

ADVERSE.—† 77. MISCRILLANKOUS PRONOUNS.—† 78. GIFTER PRONORMS.——† 79.

SO. CONCLUDING REMARKS.

§ 63. The Personal Pronouns in all the seven languages are singularly homogeneous in type, and their analysis is rendered comparatively easy by the fidelity with which they have preserved the Prakrit forms. In this respect they stand in contrast to the nouns which have so widely departed from the ancient models. The first and second persons run parallel to one another, and have four fundamental forms, namely the nominatives and the obliques in both numbers. The genitive is a possessive pronoun, and, as in the noun, adjectival in form. It will be treated separately.

Of the first person the forms are as follows:

	NOM, SING.	DEL SINO.	X0M+ 2/L	ORL PL
Hindi	हीं, अं [म]	सुझः मो	हम	इमों-
Panjabi	इंड [म]	म	<b>भर्सी</b>	असा-
Sindhi	স্মান্ত, স্মা	म्, मा	असी	असां-
Gujarati	अं	संज	अम	चम, चमो.
Marathi	मी	सव	ग्राम्ही	ग्रान्हा-
Oriya	편	मी	प्रमहे	चरह, चरहे.
Bengali	सुद	मो	चामि	चामा:
Gipsy	mr	min	amén	amen.
Nepali	¥F	:स	हासी.	हामी:
				30 P. A.

In the above scheme are given the forms which are etymologically correct, rather than those which the people really use, for much confusion has taken place in this respect in modern times in two ways. First, H. P. and M. use for the nominative a form which is really the instrumental; H. P. & has now quite superseded the old and proper nominative et in all but a few rustic dialects; and in M., as far as I can learn, there is no trace of a form \$1, or anything like it, either in ancient literature or in rustic speech. Oriya and Bengali have for their nominative a form beginning with #, which is characteristic of the Skr. oblique; so have the Nepali and the Gipsy languages. Secondly, Oriva and Bengali have adopted the habit of using their nom, pl. wife and week as singulars, and have invented fresh plurals, O. अस्ट्रमाने, and B. आसरा, and B. has in addition struck out a plural for HE in the shape of HITI. Fashion and pandit-influence have succeeded in relegating poor HE and मोरा to the domain of "vulgar" speech, and, to a certain extent, Oriya # also; and so far has this habit gone that many natives refuse to admit that H and HT are the true old singulars, but, in spite of the obviously plural nature of week and wife, persist in regarding them as the genuine singulars.

The nominative singular et, st. s or s-for these four forms are all one and the same-represents the Sanskrit we. which loses its initial a in the Apabhransa or vulgar Prakrit, and becomes gri, which Lassen (Inst. Pr. p. 466) shows to be shortened from the Sauraseni west, so that it stands for it (Vol. I. p. 254). Hence, by elision of #, comes #d, a form which Panjabi in many of its rustic dialocts still retains. Sindhi goes a step further, and rejects the g, while lengthening both vowels. The other form, wt, Trumpp considers as simply contracted from wg; but as wg had been lost to ordinary speech long before the Sindhi forms began to be excepitated, it is more probable that wit is to be regarded merely as a shortened form of sits. Old-Hindi gi is the same word as P. gd with a slight difference of spelling; while Middle-Hindi and Gujarati is are shortenings of the same by omission of the short internal a. Chand uses \$1, sometimes written \$1, as-

### ती हीं क्यडीं देह ॥

"Then I quit this body."- i. 157.

### सो हों सब मुनत हीं मात॥

"All that I am hearing, O mother."-i. 160,

Modern-Hindi and P. #, which is now the only form in use for "I," is, strictly speaking, like Marathi #1, the instrumental; in Skr. #3; in Apabhransa #3, and apparently also #3, though Lassen is doubtful on this point (Inst. Pr. p. 480). I fail to see why Trumpp calls this an accusative (p. 189). The transition of the instrumental into a nominative is rendered natural by the use of the prayoga, in which the subject takes an instrumental form, and accordingly Chand uses # only before the preterite of transitive verbs, i.e. in the place where the subject is required to be in the instrumental; in all other places he uses \$7. Thus—

### में मुन्दी साहि विन अंदि कीन !

"I heard that the Shah had put out his eyes."-- lay, 110.

where in Modern-H, we should have 第 司 項刊. The modern finahion of saying 河南 is founded upon ignorance of the true nature of the word, and contains the instrumental twice over. In Panjabi this error is often avoided, 河 being used alone as an instrumental; and so also in Gujarati, where 河 alone is the instrumental; and so also in Gujarati, where 河 alone is the instrumental; 河 is probably from 河京; but M. has also two forms of the instrumental, 河 and 河口, the former of which refers back to 河南, and the latter to some other corruption of Skr. 河口, the intermediate links of which are not extant.

B. मुद्द and O. मु appear to have arisen from the Apabhrania form मुम्ने by rejection of the initial ह, and have probably passed through a stage in which they were spoken समृद् and समु: the first द in B. is inorganic. It is in singular accordance, as regards sound, with these forms, that Sindhi, at the other end of the Indian continent, uses also मू as a nominative, as also मा; but, as regards origin, these forms have apparently, like H. H. passed over from the instrumental.

The commonest types of the oblique form in the singular are no and not map. All occurs throughout Old and Middle Hindi, Oriya, and Bengali. It appears in the slightly modified forms of and not in Sindhi; and, if we are to write Paspati's man as not, in the Gipsy also. Although, in treating of the genesis of the oblique in nouns, it was stated that not the genitive alone, but a sort of conflation of all the cases in Prakrit fused down into one lay at the origin of the modern form, yet it was also

"Lassen probably reads 實知 for 更复 in Vikramarusa, Act iv. (p. 03, Cale. ed.), where the Calcutta addition reads 相写. The time is: 史相知 現實有 神和市 電氣 恒期 可知识的. Here it is clearly a nom. "If I, wandering about the world, shall find my love," as the Skr. gloss gives is: 现象 贝里奇 动和中 电反 原动 新闻 和中 电反 原动 is to stand, it is a motoworthy instance of a construction which has now become universal in Hindi, by which the instrumental is used for the nominative even behave suchs in the present and future, and not only, as in the Karmani prayoga, before the presents.

admitted that the genitive had exercised a potent and perhaps slightly proponderating influence. Here, in the pronoun, the genitive has clearly been the foundation of the modern type. The genitive in classical Prakrit and Pali is not here alluded to, so much as that of the Apabhransa. In the classical Prakrit the genitive stands as सम. मह, संद्या, and में : Hala uses सस (once), मन्द्रा, सह, सह, में, and अए: and Pali has सम, समें, सहा, and wrg. Of all these forms, Hain's Hg seems the most popular, and stands one step higher than the Apabhransa Hy. from which comes directly the S. genitive #3. Of the introduction of a into the first syllable in this word, and in H. HH, notice will be taken further on. His would become all and all, just us the objective affix and becomes, as we have seen, aff and al. Of all we have, indeed, no instances; but then we have no writings of the period when it was in use. In Chand and his successors सो, with its oblique affix हि, occurs frequently. First सी, with or without case-affixes-

#### विम उधार मो होइ॥

"How shall there be salvation for me."-i. 188.

## भट्ट जाति कवियन मृपति । माच नाम मो चंद्र ॥

"Bhat by custe. King of poets, Lord! say name is Chand."-vi. 18.

### वैसी कहि भी कई डर पावज ॥

"Having thus said for me you find fear."- 1 160.

#### जो मो सो साच न वही ॥

"If you do not speak truth with me."-i. 157.

Secondly, wife and its shorter form Hig:-

### जो मृहि हुंडा निगलिहै ॥

"If Dhundha shall swallow me."-i. 170.

#### कत्यी मोहिनि वर मोहि॥

"Quoth the lord of Mohini to me,"-i. 192.

### नहीं मीडि काम पिता राजधान ।

"There is no business for one in my father's palace."-Ixiv. 366, vot. 11.

In Old-Bengali also the closely-allied will is the regular form in use. Here the final e is short and = i. Bidyapati has:

### वि वहसि मोहे निदान॥

"What does thou say to me after all?"-Pad.

#### मी विने खपने न हरिव चान॥

"Except me, in sleep thou shalt not see another."-Pad.

The other form HH is derived from HHH, one of the Prakrit forms of the genitive, and owes its a probably to assimilation to the pronoun of the second person HH. M. and G., while changing the H into H, retain the vowel a, and use HH. Chand uses HH not only as a genitive, as in

#### इह धरनी मुझ पित पर्पित ॥

"This land (was) my father's and forefathers'."-i. 279;

but as an oblique generally, as in

### त् मुझ अपहि माई॥

"Tell thou to me, O mother!"-i, 147.

Modern-Hindi uses a form 現象, which is made by adding e, the usual sign of the oblique in nouns, and indicates the objective case; the affixes of the other cases are added to 現實 alone, as 現實 以下、稅、etc. The genitival origin of the form has been quite forgotten.

Gujarati is very unfixed and irregular in the oblique eases. It takes सञ्च alone for the genitive, at least so say the grammars; and, moreover, makes it the oblique stem, to which ease-endings are attached, as सञ्च ने "to me," सञ्च थी "from me." The old poets use also सञ्च. "Thus—

### मुजने तजवा श्रेकली कटण करी को मंत्र ॥

"You form the cruel intention of leaving me alone."

—Tubi in Kävyn-d. i. 4.

In addition to this, however, it uses the form of the genitive (mase nom.) HIT as a fulcrum for the ablative and locative, as HIT HI "from (of) me," HIT HI "in (of) me;" and the

oblique form of the same HTT as an instrumental and dative. These are confusions arising from the consciousness that the oblique my was really an old genitive; so that, when they got a new genitive, they used it also as an oblique. One hears in Hindi also, colloquially, such expressions as Rt & " from me." due to the same sentiment. Marathi elides the final w of Hw in some cases; thus we have HawI and HWI "to me," HAWI and सभी "against me." In the locative, it, like G. and H., uses the oblique genitive माद्रे shortened to माद्रि, and with the i further recrudesced into 3, as a fulcrum for the case-uffix, thus producing appears "in me," precisely parallel to G. HIST HI-Oriya and Bengali use their oblique form all regularly throughout. O, has, however, one curious exception, making the objective मोते, or shortened मते (mote), instead of मोक, which would be the regular form. As a nowhere occurs as a case-affix in O., the only way that I see of accounting for this form is to suppose that we have here a shortening of the affix art or at. which in H. and others has the sense of an objective, so that मते = मो तर = मो ताई.

§ 64. In the planal, Oriya preserves the Prakrit form unchanged as regards spelling with, but pronounces ambbe, the insertion of the b being due to the influence of the preceding labial q. Bengali with appears to be merely a softening of with, which in Hindi has undergone transposition, the q having been thrown back to the beginning of the word, just as the verb ? "is," for qq, by transposition from wife, shortened from wife. Nepali exhibits a form quit, as my informant writes it, which should probably be grin; the long i being almost universally written for short i in rural Hindi. This form is transitional to Bengali, and the short i must be regarded as a corruption of the final s of wife. Gujarati writes wit, but in a majority of instances the rural population use quit, which is not necessarily more correct than wit, though the analogy of

Hindi would lead us to expect it. The Gipsy form snews, perhaps to be written wit, agrees closely with this, and suggests the possibility of the g having been simply dropped from the Prakrit form. M., in its form wife, seems to have done for the plural the same as it does for the singular, namely, transferred the form of the instrumental to the nominative; for the instrumental in Apabhransa is wife, and the objective wife. From a confusion of these two would arise wife; this, with the massl wife, is now used as the instrumental plural; and the two forms wife nom, and wife instrumental plural; and the two forms wife nom, and wife instrumental plural; and the two forms wife nom, and wife instrumental plural; and the two forms wife nom, and wife instrumental plural; and the two forms wife nom, and wife instrumental plural; and the two forms wife nome wife in wife a derivative from wife.

P. and S. stand alone in having a nom. pl. well. Trumpp does not offer any satisfactory explanation of this. It is true that Pr. well points back to Skr. well; but we cannot leap over Prakrit and take our form from Skr. direct; nor, if we did, would it help us with the long final i and anumasika. A change of we into wis a well-known feature of these two languages; but a reverse change of winto wise into with a quite opposed to their habits. Kashmiri has a similar form, which in one vocabulary is written to or well, in the other will.

Kashmiri and that group of ancient Aryan dialects still spoken in Dardistan differ from the cognate languages of the plains of India in having a fondness for #, which they often retain in places where the latter would modify it to #; and it may be conjectured that P, and S, derive this form from some intervening dialect of hill Prakrit which has not come down to us: they also retain the # in the oblique cases of the plaral. The other languages derive from the Apabhransa genitive \*\*\* with which Oriya is identical. In H, the # has, as in the nominative, been thrown back to the beginning of the word. Although I have given the oblique form as ##\*, yet in practice this is hardly ever used, the case-affixes of the plural being added to

हम, as इस की, इस पर. There is also a crude oblique हमें used without affixes, which comes from the Apabh, accusative अन्दर. G. affixes its case signs to a form अभी or to अस, the former being the same as H. इसी, and, like it, seeming to postulate a genitive अन्दर्भ, formed on the same principle as the gen. pl. of nouns; the other form अस is clearly from अन्दर. M. आन्द्रा is formed by lengthening the vowels from the same, and so is B. आसा. In fact, all these forms are so closely similar to the Prakrit as to offer no difficulty in their analysis.

§ 65. The second person is an exact parallel to the first, and
its forms are as follows:—

	SING, NOM,	SING. OBL.	PL NOM.	TA. OHL
Hindi	तू [त]	तुझ्	तुम	तुम-
Panjabi	तूं	ति	तुसीं	तुमा, तुहा.
Sindhi	す	तो, तुंड	तहाँ, etc.	तद्वां, etc.
Gajarat	d	तुव	तम	तम, तमी,
Marathi	त्रं	तुज -	तुरही	तुम्हा-
Oriya	व	तो	तुरई	तुम्हः तुम्हे-
Bengali	तुर	ती	तुमि	वोमा-
Nepali	त	त	तिमी	तिसी-
Gipsy	tu	\$4	tienela	tamen.

There is a striking uniformity in the nom, sing., for even H. has in many dialects the form  $\frac{1}{2}$  with anunasika, though this is rojected in classical Hindi. All the early languages of the Indo-European family have as their base ts. The Skr.  $\rightleftharpoons$  is exceptional, and, as Bopp shows (Comp. Gr. § 326), the ns belongs to the case-ending, and the a is inserted between this ending and the base in all instances where the base does not already end in  $a_i$  so that before this inserted a the s of an

original 7 has been hardened to 7. Thus we may assume a form 7 for the type of this pronoun. The Prakrits exhibit a considerable number of forms; the commonest in scenic Prakrit is तुम, side by side with which is तुच ; and in Apabhransa तह. where the wis merely a stop-gap. By eliding wand lengthening the labial vowel we get \$\forall \tag{the commonest form of the nom. in the modern languages. I take no count of the difference observable in the quantity of the vowel, though in some languages we find 有, and in others 有, because these languages for the most part, as has been frequently shown, ignore the difference between and i, u and u. Hindi a is like a of the first person, the instrumental at of Apabhr, brought over into the nom. It is a word of the rustic and vulgar side of the language, and is only used by the educated classes contemptuously when speaking to inferiors or domesticated animals. In P. it is still the instrumental, just us a.

The oblique has two principal types, 南 and 南朝, corresponding to 南 and 南朝 of the first person. 南 is used in Old and Middle-Hindi, and still in B. O. and S. and is derived from the genitive of Apabh. 南京, which S. preserves in its genitive under the form 南京 alone. 南朝, which becomes in M. and G. 司朝, is from another Apabh. form of the gen. 司朝. Nepali stands alone in having dropped the vowel altogether.

The nominative plural Pr. कुछ is accurately preserved in O. कुछ (pronounced कुछ), slightly shortened in B. कुछ; and M. here, as in the first person, takes over the instrumental कुछ in the form कुछो nom, and कुछो instr., which some ignorantly write कुछो. H. here also, as in the first person, writes कुछ and कुछ, which latter is the Gipsy form also. Nepali किसी has singularly changed the characteristic labial vowel to a palatal, just as (§ 51, p. 235) it has िखत for छुछो.

Panjabi makes its pl. nom. quit, which is us great a puzzle as well of the first person, and for which I can as yet assign no satisfactory derivation. In this case Sindhi parts company with

P., and exhibits a very great number of forms, which, however, are arrangeable under two types. Thus—

# तहीं, तबीं, तहीं, तहें. बहीं, बबीं, बहीं, बाई, बंई.

The first form in each of the above lines is evidently the real form from which the succeeding ones have arisen by shortening, clision, and other simplifying processes. The is, I think, like M. 1788, the Apabh. instrumental 1788, where the a has been changed to as, and the m first weakened into anumasika and then dropped altogether. It might also be accounted for by comparing it with Gujarati, which drops the labial yowel and uses an. If Sindhi has done this, then the a is a softening of m, as in H. 1888 from u.m. The other series, of which ust is the fullest form, is quite unparalleled in the whole group. Trumpp's explanation is probably correct, that it comes from a form Pr. 1888, Skr. 1881, where the initial a has been clided and a changed to as, as in as T. Even if this be the correct explanation, we have a most unexampled retention of a very archaic form which has never found its way into literature.

In the oblique plural H. uses तुझ, as in the nam. The other languages mostly retain the form तुझ्ह, which is the base of the Prakrit pl. in all cases, and stands alone in the genitive. The modern languages generally add long d or án, as M. तुझ्झ. B. तोझा, S. तुझ्झ, the latter with its parallel series चूझ, etc. G. follows Hindi, but substitutes a for a in तम and तमा, which latter agrees with H. तुझ्झ. Panjabi तुझ seems at first sight to agree with the other languages; but the g is here in reality merely the ordinary Panjabi substitute for the g of तुझा.

§ 66. As in the noun, so also in the pronoun, the genitive is really an adjective agreeing with the governing noun in gender and case. The forms, which depart very much in some cases from the type of the oblique, are here given.

	I. PERS. SING.	T. PRINCELL	II. PRES. STREE,	D. PRES. PL.
Hindi	मेरा	हमारा	तरा	तुम्हारा-
Panjahi	मेरा	असादा	तेरा	तुसाडा, तुहाडा-
Sindhi	मुंबं की, etc	असां जो ल	त तुंड जी etc	तहां जो सहां जो etc.
Gujarati	मारी	अमारो	वारी	तमारो.
Marathi	माझा	यामचा	नुसा	तुमचा-
Oriya	मीर	सम्हर्	तोर	तुम्हर.
Bengali	मोर	जामार	वोर	तोसार.
Nepali	मेरी	हास्रो	विरो	तिस्रो.
Bhojpurl	इसर, ॰रो	हमार	तुहर, वरो	तुहार.
Marwari	मारो	न्हारो	तरो	षारो.

Sindhi in this group merely uses the ordinary oblique with the genitive suffixes, and Marathi does the same in its plurals, simply dropping the # of चस्ह and तुम्ह, while in its singular it makes a compound form मज + चा = माझा, and तुज + चा = तुझा

Leaving these two languages aside, the rest exhibit, under different forms as respects quantity and attendant vowels, uniformly a type in \(\tau\), which we have no difficulty in connecting with the older genitive of the noun formed by the affixes att and att. It has been customary, however, to give a different origin to these forms. Those who have done so have unfortunately taken two extremities of a long chain and compared them together, totally omitting the intermediate forms, with which they were probably unacquainted. Bopp, whose knowledge of Hindustani was necessarily very limited, derives H att, att, from Skr. att "mous," att "tuus;" and in the same way eniti would be for aresiti (as it is) from and and great from guarda. The process is said to be effected by the change of \(\xi\) into \(\xi\) and then to \(\xi\), just as in the numerals

Skr. एकाद्य becomes Pr. एकादइ, H. द्यादइ. But we may look in vain in Prakrit for the intermediate forms with इ, and the termination देख of Skr. does not produce masc. d, fem. l, in the moderns.

The pronouns use the same affixes for signs of all other cases as the nouns do—\(\frac{1}{4}\), \(\frac{1}{4}\), \(\frac{1}{4}\), \(\frac{1}{4}\), \(\frac{1}{4}\), \(\frac{1}{4}\), \(\frac{1}{4}\), and the rest; it is therefore fair to assume that they use the same signs in the genitive. Chand uses \(\frac{1}{4}\) and \(\frac{1}{4}\) as genitives as well as other oblique cases; but he knews already \(\frac{1}{4}\) and \(\f

Thus with a slightly different meaning, the former being a pure genitive and oblique, the latter possessive adjectives. In O. and B. With forms the genitive by adding \(\tau\); without this it is merely the crude form of the oblique cases. That this \(\tau\) is shortened from \(\tau\) was shown under the noun; and as in the Oriya noun, so also in the pronoun, this \(\tau\) is found in full in the places, as well as shortened \(\text{WFEC.}\). Old-Bengali has a genitive \(\text{FFEC.}\) in which, as in the genitive of the noun, we have the shortened form from \(\text{AC.}\), with dropping of the \(\tau\).

I see no reason, therefore, to assume any other origin for the genitives of the first two persons in \(\mathbb{\cappa}\) than that assigned to the similar form in the noun; for even if we were to admit \(\pi \alpha \) and its cognate forms to be the origin of the possessive pronoun, we can find no parallel forms for the similar genitive in \(\mathbb{\cappa}\) of the noun. This \(\mathbb{\cappa}\) genitive is an obscure and rustic but undoubtedly ancient form, which has only recently been brought to light, first by myself and subsequently by Hoernle. It was not known to Bopp or Lassen; had they known it, they would probably have abandoned the \(\mathbb{\cappa}\) theory.

The only point in support of that theory is the curious Panjabi genitive pl. warg; mada; but the Panjabi plurals of the 1st and 2nd personal pronouns are formed upon a different system to those in the other languages, and an argument derived from it would not be fairly applicable to them.

Popular Prakrit has such forms as ne att, from which net would naturally flow; and the rustic form of the same, namely net, would equally be derived from ne net. So also in the plural, where Marwari relt is need, and net for gere, through a well-known Old-H. faret from gree + net, where the na has been dropped. Documentary evidence is certainly wanting for earlier forms, but this is because the modern forms were already in use at the dawn of medianval literature.

§ 67. For the pronoun of the third person, a direct descendant of the third person of Sanskrit is not always to be found, its place being generally supplied by the near and far demonstrative pronouns, which are reduced to their simplest elements ₹ and ⋜ respectively.

It is first necessary to pick out the few traces remaining of the genuine old third person, which in Skr. starts from a stem a. making, however, its nominative case स: m., सा /., सत u. Bopp shows (\$ 341) that there is not in Sanskrit a pronoun of the third person with a purely substantive signification, but adduces the stom or as having originally occupied that place, and given rise to the Pr. 3. It is not our province to go beyond what we find in Skr., and it is sufficient to remark on the traces of the stem a which still exist. In Hindi we have wi "he," but often used as a correlative pronoun, unswering to the relative si-Another form at has now become an enelitic particle, but in Old-Hindi we find तीन and the oblique form तीने का. को. This answers to will interrogative, and will relative, and all three forms arise from compounding with the pronominal stem the adverb पुन:, Pr. उपा, so that तीन is तो उपा. Although पुन: means strictly "again," yet in the moderns it has changed its meaning; and when used as an enclitic, means merely "indeed,"

or nothing at all beyond a little additional emphasis, like the Grock µev, ye, δe, etc.

सो is used as a correlative in most of the languages, as in Hindi—

### को पीता सो महता

"Whose drinks (it), he dies."

#### जो जो वैशी संबंद सो सो विर मार

"Whatsoever enemy attacks thee, he falls dead."

—Billot, Races N. W. P., vol. i. p. 65.

In Panjabi it is used in precisely the same way. So also in Sindhi, where it occasionally stands alone, us—

### सी ही उसे उस सो अवनुसी कबड़ ॥ सो भी सी पसाइ सो वेरी सो वाहन ॥

"He is this, he is that, he is death, he is Allah,

He friend, he breath, he foc, he helper."

Trumpp (qualing Sh. Kal. i. 19), p. 205.

In Maruthi at is sometimes used to mean "he," but its real meaning is "that," the far demonstrative; it is not the third personal pronoun, but an adjective varying in gender according to the substantive with which it is connected—at m., at f., at m. It may therefore be postponed till we come to the correlative.

Gujarati, however, uses 元, pl. 元献, as a substantive pronoun = "he." Bengali and Oriya have 元 "he," not unfrequently, however, used as an adjective "that." These forms show a softening of the c of Pr. 元: Nepali 元.

The oblique singular is H. तिस; P. तिस, तिह; S. तिहि: G. ते; M. सा क., ति /: O.-B. ताहा. ता: Nepali तस. All these forms come from the Sanskrit genitive तस. Pr. तस. Chand uses तस and तास, in the latter of which the long vowed is compensatory for rejection of one of the two consonants. He also uses वाहि and shortened तिष्टि, forms resting on the Apabhranéa Pr. तह, ताह and तिष्ट (Lassen, p. 482), Thus—

### वाके देह नहीई। ताहि कैसे के महिये।

"(He) of whom there is no body, Him how can one seize?"—i. 161.

### वज्रङ्गवाज्ञ चरिद्वसमन ॥ तासु वित्तो चंद वहिय॥

"(Him) whose arms are thunderbolts, who crushes the heats of foes, Of him the glory Chand speaks."—i. 46.

Here the u in tasu is a mere metrical tag. Even in Chand's time, however, this word was used as an adjective, and instances will be given under the section treating of the demonstrative pronouns. Bengall has in this third person, as in the other two persons, seen fit to have a finer term than the simple ordinary a, and for this purpose it takes faff, which is really the oblique plural corresponding to the oblique plurals of the other. languages-H. fan, P. fant and faret, S. afn, M. wit: all of which come from the Pr. genitive and with the long a shortened into a and still further into i. Bengali having made fafa into a nominative singular, has struck out a new form Higg for the oblique, differing only from the ordinary oblique arei by the insertion of anunasika in the first syllable. Oriya, on the contrary, has for the nom, plural no organic form, but adds to the singular its modern plural sign माने, making समाने; for the oblique it uses either an organic form ताहंबर, तांबर or सेमानंबर. a genitive of the modern fashion.

§ 68. The demonstrative pronoun falls into two divisions, that which indicates a person or thing either present or near at hand, and that which indicates a person or thing absent or at a distance. The former in all Aryan languages has the type \(\circ\) the latter \(\mathbb{R}\) or \(\mathbb{S}\). Thus in English, "this" and "these" have the palatal vowel, as contrasted with "that" and "those," which have the guttural and labial vowels. It would be foreign to our present purpose to make any remarks on the evidences of the universal distribution of these two types throughout the range of the Indo-Germanic family; but it may be observed that it is not confined to that family, but is found more or less in all the languages now classed as Turanian; and if we are to admit the fundamental unity of these two groups, this uniformity in so elementary and radical a part of speech is highly significant. Thus in all the Dravidian languages i is the near, and a the far demonstrative, while a holds a middle place between the two,—as in Tamil ida, "hoc," ada, "id;" Telugu idi and adi; Canarese ida, ada; Malayalam ita, ata,\(^1\) So also—

Tamil ican "hic," acan "ille," ical "hec," acal "illa."
Telugu, iada "hic," conda "ille," idi "hec," adi "illa."

To return to our own special subject. The seven languages exhibit the following range of forms:—

#### I. Near Demonstrative-"this."

	WOOL STREET	OHL SING	NOM, PL	out Pla

<sup>&</sup>lt;sup>3</sup> Caldwell, Dravidian Comp. Gr., p. 333; Campbell, Talagu Gr., p. 77.

#### II. Far Demonstrative-"that."

11 m
eți.

Marathi and Oriya use the correlative, which is also the pronoun of the third person, M. तो, O. चे, instead of the far demonstrative.

In Sanskrit, the primitive type v is overlaid by accretions, which render it somewhat difficult to identify (Bopp, § 360). The form which this pronoun has assumed in classical Sanskrit is चर्च m., र्यं f., रदं n.; and in Vedic Sanskrit there is a form To neuter, which, however, is used merely as an emphatic particle. Scenic Prakrit has nom, www., Tw.f., Tij a., and an oblique base रूम, also रूब (Lassen, p. 326; Weber's Hala, p. 55). The ordinary Apabhransa of the plays has to, and in the songs in the fourth act of the Vikramorvasi are found loc. pl. इमेर्स (Skr. एप); से "of her" (Skr. बस्ता); दुराक्दी ब से प्याकी "and excessive is her affection;" veg, abl. sing. "than it" (Skr. wurte), and other similar forms. But it is perhaps useless to seek for the origin of the modern forms in any written They have their origin in all probability in a much works. lower stratum of popular speech than ever found its way into writing before the time of Chand, whose forms may therefore in this, as in so many other instances, be taken as the furthest point to which researches can at present be pushed back.

The types of the demonstrative in the Prithiraj Rasau are the fellowing:—

besides variations caused by the metrical necessities of the poem, and having no value as organic forms.

### मोहि इह भागम बुझझे॥

"To me this scripture is clear."-iii. 28, 2.

Both the nom, pl. of the far and the emphatic singular of the near demonstrative are shown in the lines-

### वे बाहे तरवारि ॥ इहे सुष पक्करि सु कट्टै ॥

"They ply their swords, he catching them in his mouth bites them."

—1. 254, 5.

## विहि काज तुम इह धम्म सीन॥

"For what cause have you taken up this religion?"-i. 172, 6.

### यांहि सम्पूरन को चिर कार्व ॥

"To complete this is a work firmly resolved on."-i. 87, 6.

Shortened to TE and oblique in sense:

#### इहि विधि आनल वत उचारिय॥

"In this feshion Anal uttered (his) speech."-i. 155.

The ordinary modern form of the oblique, as in H. दूस, like the oblique of all these pronouns, appears to lead back clearly to the Skr. gen. www. Pr. www; and the forms दूह, दूहा, etc., with the older forms in fg. as wife, alfe, alfe, alfe, alfe.

show the ordinary oblique of the noun, produced by a general fusion of all the oblique cases of the old inflectional system; while the plural oblique in warises from the Skr. genitive with. Pr. with. Sindhi, however, has its singular oblique in w, and thus differs from all the other languages. This seems to derive its origin from the Apabhransa forms of the singular oblique way and we mentioned above.

In practice, no distinction is observed between these two forms of the demonstrative and that of the third person, the demonstratives having to a great extent usurped the place of the latter, and being freely used to signify "he."

To truce the steps by which the various languages have arrived at each of the slight modifications of the general type by which they are distinguished, is a task impossible in the present stage of the inquiry. Much might, doubtless, be accounted for by the phonetic tendencies of each language, but this would not be sufficient to explain the whole. In the absence of a continuous chain of literary monuments which could be trusted to reflect faithfully the actually current speech of their respective periods, it is beyond the power of any scholar, however laborious, to work out all the steps of the problem. Experience has taught us that in India literature is never a faithful reflector of popular speech; and all that can now be done is to point out that one uniform type underlies the whole range of forms in the whole seven languages, and that this type can be traced back to the earliest stage of Arvan speech; while, at the same time, nothing more than the general type, the two leading ideas of i for the near, a and a for the far, demonstrative, can be with certainty identified:

§ 69. The relative pronoun meaning "he or she who,"
"that which," and requiring a correlative or answering word
in the second clause of the sentence, is indicated in Sanskrit

by the type q, which in Prakrit, followed by the modern languages, becomes q. The scheme in the seven languages is this:—

	NOM. SEND.	SHE SENG.	NOR: PL	trata Pia
Hindi	जी	विस	Til I	जिन-
Panjabi	बो	विसः जिह	वी	जिनां, जिन्हां.
Sinihi	भो m., आ f.	विशि	à	वनिः विनिः
Gujarati	व	a	विद्यो	जेकोः
Marathi	जोल.,जी.र.जेल.	व्यामः वित	जेलचा∫.,जोह.	wit.
Oriya	बेर्ड, बे	वाहा	वेमाने -	जाहां.
Benguli	ৱ	वाहा	9	जॉहा-

Hindi has also alte, Pr. all zw., which is, like alte, produced by the incorporation of un:. From this source, also, springs O. बेट, in Old-Oriya sometimes written बेट, where the guttural nusal w is the first step in the weakening of w to anunasika, The relative portion of this compound word takes in O., as it does also when uncompounded in O. B. and G., the Magadhi nom, sing, form &, which makes it identical in form with the nom, pl. The oblique forms in all the languages are from the genitive sing. Skr. ver. Pr. ver, with weakening of the vowel, and Skr. gen. pl. धानां (instead of the classical Skr. चेपां, which has not been preserved), Pr. wrui. Old-Hindi has its oblique singular fafe, which is more modern in type than the Modern-II. fau; this latter, however, was probably in use contemporaneously with forfe, as we have in Chand forms we and WIH. The plural in Chand takes an emphatic addition, and is fmq; but this seems to be restricted to the instrumental. Bengali takes this plural in the shape of fafe, and makes it into an honorific singular nominative.

§ 70. The correlative is based on the Skr. #; and is the same as the pronoun of the third person mentioned in § 67. Many of the forms were given in that section, and all the others may be made on the model of #T by substituting # for #. Nothing further need be said about it, as it is precisely homogeneous to the relative.

Occasionally an emphatic form of those two pronouns is used formed in H. by adding at or to as with. The but in Sindhi only to is added. It will be observed that, of all the languages, S. and M. alone treat these two pronouns as pure adjectives, and give them the distinctions of gender. S. at m., at f., but in pl. only a for both genders. M., with its customary redundance of forms, has all three genders for the nominatives of both numbers, but in the oblique singular only m. and f., and in the oblique plural only one form for all three genders.

§ 71. The interrogative pronoun is just as uniform as all the others; the only difference is, that forms which, though they exist in the other pronouns, are in them kept rather in the background, here come to the fore, and displace in common speech the forms which correspond to those more frequently used in the others. Thus, in the relative and correlative, wi and wi are in Hindi the commoner, all and all the carer forms; but in the interrogative, wild is the ordinary form in modern use, while at is archaic, poetic and dialectic. The neuter, also, has a form of its own, whose origin ascends to a different Sanskrit word from at. The type of the interrogative is everywhere w, just us w is of the relative. The table of forms is given, because, although exactly corresponding to that of the relative, yet the exhibition of the whole set helps the eye to make the comparison, and brings out more clearly the symmetry of the pronominal forms, which is a striking and beautiful feature of this group of languages.

	NOW. SING.	ORL SING.	NOM. PL.	SHE PL.
Hindl	कोन	विस	कीन	विन, विन्ह
Panjahi	कोण	विसः विश्	कीग	किनां किन्हां
Sludhi	कोग्र =	विषि	-	कनि-
Gujarati	(कोगा, क्यों m.,) वर्ष (- कर्र ग.)	बे बो	क्या ल करें र क्यां क	के. की-
Marathi	कोष	कोगा	कोण	कोवा
Oriya	वित्रं, वि	वाहा	केमाने	वाडां-
Bengall	3	कादा	वे	काँहा-

Simili has and only in the neuter; its plural nom, is not used; and in commoner use both in Sindhi and Panjabi is the form S. to m., at f., P. agai m., of f., obl. aga, which is from Skr. algu, Pr. after and later after, which in S. merely drops the g; while in P. the t+g have been moulded into g, and then again split into g+z. Old-Hindi preserves the symmetry by using nom. an, obl. fals, as—

#### को किहि वंसहि जपन्यी।

"Who (am I), from what race sprung?"-i. 147.

Here, again, comes in the Skr. gen. 48, Pr. 48, as in the relative. Gujarati has singularly introduced a hiatus, writing which will be explained hereafter. The forms with 98; added are here more widely used than in the other pronouns, perhaps because of the somewhat greater emphasis involved in asking a question. In all languages "who?" more often stands alone, almost like an interjection, than any other pronoun, and thus the Pr. 38, which has sunk into an euclitic, would be more frequently used with the interrogative.

The neuter stands alone in all but a few exceptional instances, and is as follows: Old-H. कहा, oblique बाहि. Modern-H. क्या, obl. काह and किस: and the same in the plural.

P. की. विश्वा, old. कास. काइ.

८ बोज

M. काय, obl. कम्। कसा, pl. the same, but obl. कम्। with the usual anumbiks of plurals.

O. 電班, fu. In Balasore fue (kisō).

B. कि. क्सि.

The origin of all these forms is to be sought for in the Skr. In, an old neuter. B. In. H. In. P. WIN, refer back to the genitive, which in Pr. is well, semetimes also win. H. WEN is apparently a conflation of the oblique forms g. WE, abl. WE, loc. wife, and win the ordinary modern form, from supplying the histus of a form win by we instead of w. as in Gujarati. Prakrit has also an oblique win, whence Sindhi will by softening of d to e; from its retaining the d in the first syllable the Hindi oblique will exhibits a form which postulates a Prakrit wiefs.

Gujarati has an unique interrogative \$\textbf{N} t m., \$\textbf{N} f m., \$\textbf{N}

into \$\pi\$: an initial \$\pi\$ stands firm for the most part, at least a change from it into \$\pi\$ would be of too radical and wide a nature for the modern Indian languages, which do not deal in those vast organic changes which were at work in the infancy of the world. We must rather look for the origin of this form by the light of changes of such a nature as are prevalent within the restricted limits of our group, instead of hunting up all possible modifications in every country and age to which the Aryan speech has penetrated. If we can with difficulty find a single dubious instance of the change from \$\pi\$ to \$\pi\$, so frequent in Sanskrit, among its descendants, we should hardly be justified in going further back still to search for a change, which is in

point of time prior to Sanskrit itself.

The origin of wit is to be found in the earlier form with, a neuter signifying "what," from which have been constructed a masculine and feminine and and, which are also used as an indefinite pronoun, and, as will be seen presently, the only form in use for the oblique plural of the indefinite is way. This form would lead us back to Pr. wiften, Skr. wign, from which, as we have seen above, Sindhi and Panjabi draw their interrogative. affer becomes in H. SHI, and in Old-Hindi the forms are कहसा and कसा, the latter produced by elision of the short i. With this last-named form our Old-Gujarati wit is identical, for W is not in this language necessarily the palatal sibilant, but rather the distinction between it and # having been obliterated, and only one sibilant sound remaining, the letter used to express that sound is sometimes #, and sometimes #, according to the habit or caprice of the scribe; so that we might here also compare the oblique in M. ser or say, instead of treating it as from a Skr. gen. au, Pr. au, which would not account for the final long d. Sindhi ter is probably also of like origin, to being often interchanged with W in all the modern languages; or aut might also have lost the a of its first syllable, and become T. whence the transition to by is in accordance with the usual law,

It is more probable, however, that both in S. and G. there has been loss of initial w, as it is not in harmony with the general phonetic laws of this group to suppose the creation of w from w+w at so late a date as we must assume, to bring it posterior in point of time to the tenth-century wer.

It may here also be noticed in passing that the derivation of the forms जीन, जीन, etc., from जी जन, जी जन, suggested by Taylor, is erroneous. These forms are written in the earlier stages of Hindi जनन and जनन, where the labial vowel and semivowel are indicative of the उ of पुन:. The compound phrase की उस is not a conjecture, but is constantly found in Prakrit (Lussen, § 32).

§ 72. The indefinite pronoun deviates from the homogeneous type of the other pronouns, and this deviation is explained by its origin. The forms may be given first, and analyzed afterwards. The typical letter is m, as in the interrogative; and the neuter, as in that pronoun, stands apart from the masculine and feminine. The word now given means "any one."

	NOM. HING.	OHL RING.	HOM: PE	ORL PL
Hindi	कोई	विसी	कोई कई	विन्हीं-
Panjabl	बोई	विसे. विसी	वेर्	किन्हां-
Sindhi	को ल. कार्र. कोई ल. कार्र्ड	विह	*	कंगि.
Gujarati	बोद	कोर	朝	वधाः
Marathi	कोगी, कोगडी	कोया। कोरहा	कोगी	कोगर्धा
Oriya	केउणसिः कीणसिः) केहि	काशारि -	-	-
Bengali	वेड	वाहा	-	=

These forms arise from the compound Skr. altfu (al wfu); the enclitic particle wfu in Prakrit slides into composition with the pronoun, and is written in one word alfa, from which, by

elision of the w, come the H. P. S. and G. forms. S. often, however, rejects the final \$\frac{1}{4}\$, which is lengthened in the other languages to preserve it, and because it is emphatic. M. has merely added the emphatic particle \$\frac{1}{4}\$, with \$\frac{1}{4}\$ lengthened to \$\frac{1}{4}\$ and the \$\frac{1}{4}\$ frequently dropped, to the modern form of the interrogative, so that we have a compound of three parts, \$\frac{1}{4}\$ + \$\frac{1}{4}\$ = \frac{1}{4}\$ and syllable \$\frac{1}{4}\$ appears to be shortened from the demonstrative \$\frac{1}{4}\$; so that here, also, there is a triple compound \$\frac{1}{4}\$ + \$\frac{1}{4}\$ + \$\frac{1}{4}\$, literally "who foresooth is he?" O. \$\frac{1}{4}\$ and B. \$\frac{1}{4}\$ are allied, and simply add \$\frac{1}{4}\$, which may either be the emphatic particle of Skr., or more probably the \$\frac{1}{4}\$ was inserted to prevent histors after dropping the \$\frac{1}{4}\$ of \$\frac{1}{4}\$ (for \$\frac{1}{4}\$).

Old-Hindi has कोज and oblique काह, where the a or a of alfa has softened to the labial vowel, and the final short i has been dropped, as is usual in Hindi. The oblique forms fafts or fael show the oblique of the interrogative with the t, whose origin has been forgotten, so that it is regarded as a mere emphatic particle. Marathi sites arises apparently from the fact that d is regarded as the general type of the oblique, and has been added without reflection. In ordinary current speech it is customary to add us "one" to this pronoun, so that they say कोरहा एकाचा "of some one;" and the same practice prevails in the nom. pl. of H.; thus ar un or ava some "aliqui, alique." The Oriya wigift is a curious instance of how these forms arise: TITE is the genitive of the interrogative, and by adding the emphatic & or fe to it we get will fe or wielf. which should be used as a genitive only, so that the oblique would be wire; but the genitive form has been extended to all the cases, and they now say काहारि क "to some one," काहारि टाइ " from some one," and so on.

The plurals of this pronoun are seldom used in most of the languages, and in B, and O, there are no plurals at all, the singular doing duty for them. The neuter form "something" is expressed as follows:

Old-H. 电波, Modern-H. 南连; oblique, Old-H. 屯顶, Mod.-H. 有明, but the oblique form is rurely used colloquially.

- P. WW. rarely if over inflected.
- S. al not inflected at all.
- G. 电灯 M. 朝蒙] O. 简版 B. 荷霉

H. P. O. and B. have a common origin from the Skr. faffer. the final of which is dropped in Prakrit fate. The archaic and poetical H. we seems to point back to a form in which the enclitic fun had been affixed to a neuter un, instead of कि, thus making कवित: from कह, the u has leapt backward into the first syllable, making the modern 30. The change from w to w is hardly to be accounted for by absorption of the annswara, and must remain unexplained. The three western languages, S. G. and M., do not seem to have any connexion with falag: but the last two use oblique forms of the masculine indefinite, and the first merely a lengthened form of fa with loss of the anuswara.

§ 73. The reciprocal or reflexive pronoun "self" is in most of the languages a derivative of the Skr. Will "soul, self." As a substantive it means "self," and as an adjective "own." The former is

H. आप. P. आप. 8. पाण, G. आप. M. आपण, O. आपे. आपण. B. जापनि.

The principle of phonetic change which lies at the root of these modern forms was indicated in Vol. I. p. 330. process began in Prakrit, as we have wur, wur, side by side

with war, etc. This latter form has not been adopted by the moderns.

Hindi, followed by P. and G., uses the simple nominative, rejecting one of the two consonants, and lengthening the preceding vowel in accordance with the regular practice in the treatment of the nexus. B., as in the, 3fe, fafe, etc., has made for itself a nom. singular out of a plural form. The other languages retain a final w or w, which rests on the Pr. form wursy (Var. v. 45), which by his next following satra Vararuchi extends to all other Sanskrit nouns in न् . as युवन् = अवाण, etc. Sindhi adheros most closely to the Prakrit, merely rejecting the first syllable; but the other languages, while they retain the initial W, lengthen it to W, and shorten the second syllable. I am disposed to think that this alteration of quantity is only apparent, and that the forms आपन, etc., are really derived from the oblique cases of the Pr. singular, as instrumental wwell, gen. wwell. It is observable in the modern Romance languages that where the type of the oblique differs from that of the nom., the modern language adopts the former for all cases; thus we see in Italian monte, where the Latin nom. is mous, and the t occurs only in the oblique cases. The latter being used five times to the one of the nominative, naturally acquires the predominance in the vulgar usage.

Hindi, when used as an honorific substitute for the pronoun of the second person, so also in P. and the other languages; but it has a special genitive used adjectivally and with a possessive sense, meaning "my, thy, his own," according to the person in which it is used. This therefore becomes almost a separate pronoun, and has the following forms:

- H. अपना : अपनी f. अपने obl. sing., अपनी obl. pl. (rare आपना, etc.).
- P. बापगा, श्मी, श्मी, श्मी आं-
- 8. पांहें जो, जी, etc.

- O. आपणी, श्वी, श्वां, etc.
- M. जापजा, ॰जी, ॰जें, etc.
- O. आपशार (rare, जियार is usual).
- B. आपन.

These forms are derived from the Prakrit genitive, which is satured, and the endings for gender and case seem to have been necessitated by the use of the word as an adjective. Hindi goes a step further, and uses the oblique form, just as though it were the regular oblique of an adjective using sure at, or more frequently sure at = scipsum; sure at and sure ut may also be heard in conversation, as in the phrases sure at the took the business on himself," sure ut at a faut "he took the business on himself," sure ut utility "take counsel with your own (friends)." These forms, though common in the castern Hindi area, might perhaps be set down as ungrammatical by anthorities on the language, these gentry being apt to be capricious and fastidious, and prone to brand as wrong any phrases which they do not use themselves.

There is also a curious word MUM allied to this stem, and used in H. P. and O. always with the affix of the locative, as H. MUM #. O. MUM "among our-, your-, them-selves," as MUM # WIZT "divide it among yourselves." No origin for this form can be found in any of the Prakrits, nor can the form itself be considered as a locative apart from the case-affix. It is the case-affix which contains the locative idea, and when we remember that # is from ### "in the midst," we shall see that the complement of the idea involved in the whole phrase is a genitive "in the midst of selves." I therefore hazard the conjecture that this form is like ##, ###, fam, and the rest, a genitive irregularly formed from a vulgar Prakrit MUM. which would postulate a Skr. MAM. Now though no such form exists, or ever did exist, yet we have seen in the case of the noun, that the varied inflections of the numerous Sanakrit

nominal bases have all been rejected, and the declension of the a-stem taken by the moderns as the type of all nouns; it would not therefore be at all out of keeping with analogy, but rather much in keeping with it, for the modern languages to have in this instance also taken no heed of the peculiar forms of the declension of ward, but to have treated it like an ordinary noun of the a-stem, and made a genitive in wa, as in all the parallel cases. In my own mind there is not the shadow of a doubt that this is really what has happened, and this form may be set down as one more illustration of the admitted fact that a type in common use is often extended to all classes, superseding entirely the minor types, and securing simplicity and uniformity in the place of a multitude of divergent forms.

g 74. Although the pronouns, other than personal, above enumerated, are all, to a certain extent, adjectival, yet in several of the languages they have lost those variations for gender which mark the true adjective; H. A., for instance, is used both with mase, and fem. nouns, only in M. and S. are they treated as adjectives with separate gender forms. There are, however, certain pronouns which are adjectival in all the languages, and exhibit in their initial letters the types of all the above classes. They express quantity and quality, considered demonstratively, interrogatively, relatively, and so on. As a type of them, the interrogative is here given, the whole series being exhibited in full in a future section.

### Marrathi कितका, की, के कमा, की, के. Marrati कितरो, की किसी, क्सी.

O. and B. having lost all gender, do not inflect the adjective; they use the following: O. 高元 "how much," B. 氧元. The former series, that indicating quantity, is based upon Skr. faun (m.), faun (f.), faun (n.), which in Pr. becomes 南行城 (Var. iv. 25), also 金夏夏. The older Hindi form is 五和, which is an immediate descendant of the Pr. form. Thus Chand—

### बेते नर रिष राई ॥ सए सुर दानव अरने ॥

"How many men and Rajūrshis have there been, (and) gods and demons of you?"—i. 162.

The addition of the affix we in Bengali indicates affirmation, and the affix seems to have been at first distinct; thus in Old-Bengali we regularly follows we (koto), as in Bidyapati:

### कत ना जतने कत खद्भूत विद्य विह तीरे देन ॥

"With how much labour, how many wonders has fate brought to thee!"

—Pal 1362.

### कत ना जतने कत ना गोपसि हिमे गिरि ना नुकाय ।

"With how much labour, how much soever thou coverest it, the snawy mountain will not be hidden."—Pad. ib.

In fact, in the eastern area and in Orissa wand we are not negatives only, but affirmatives also, the sense depending on the sentence or on the tone of the voice; thus in Oriya:

### मो घरकु जिबु ना जिबि

"Will you go to my house? Yes, I will go."

आ is probably in H. a diminutive (§ 24), and with this agrees the S. and the Marwari कितरो, where रो is also a diminutive ending, as is also the जो of G. केटजो, and so perhaps is का of the Marathi. This क is a common addition

to the pronouns of this series; thus we often hear in eastern H. fana, and in M. fana; it is, I think, erroneous to connect this a, as some grammarians do, with wa, supposing we to be used as was, was, in Spanish, in the sense of "some." The wappears to be the sign of the nom. pl., and does not belong to the affix, which latter consists simply of w, a longer form of which is a, and a longer still wit, from which a or we is made by omitting the . Both forms occur with the prenoun and in one passage of Chand—

## जाने देह न होय। ताहि कमें के महिये॥

"Of whom there is no body, him for can one size?"-i. 161.

And

## जिलां दिए न भिदे। तालां केसे करि सुद्री।

"Where sight does not pierce, there how can one see?"-ib.

The group test, etc., comes from Pr. after, Skr. algu, as has been already stated. P. and S., more mo, change u into g, making ag and shortened fag, to which S. adds the diminutive ending at. G. and appears to arise from the substitution of s for h, which is characteristic of the Rajput dialects of Hindi, from which G. sprung.

There is another series meaning "how great" in some of the languages, which arises from a composition of the Pr. well (Skr. चूड) or पढ़ी "great." This is S. कड़ी; P. कड़ा.

<sup>1</sup> Dr. Biblie's welcome amount common of his discovery at Josephson of the Fibrance's parties, or Chronicle of the Chalakyas, leads us to hope that we shall now have some trustworthy data as to this interesting race, valuable for the early history of Gujarati.

कहा G. केवडो: M. केवडा; O. केड (indeelinable). Thus Dinakrishna-

> काम मदे तु हो इ मत्त भोळा॥ कद मझ ठरिया एडे हेळा॥ कि तु जानुनाई ए जेंडे सद॥ कुच जुमल तोर जेंडे गुद॥

"Thou, drunk with the wine of love, forgetting
Art, thy waist how slight (it is).

What, knowest thou not how small it (is),
Thy twin breasts how heavy?"—Rasskallol. iii. 43.

Hindi does not possess this form, saying instead fact at and the like. Sindhi hore, also, uses a diminutive after meaning "how small?" a form which is not in use in the other languages. The whole of these series will be seen in their correspondence with the adverbs, the generic types running through the whole with admirable regularity.

§ 75. Sindhi allies itself to Persian and Pushtu by a practice foreign to its sister tongues of suffixing pronominal signs to nouns, pronouns, and verbs, a complicated and difficult system, from which the other languages are fortunately free. These suffixes are, according to Trumpp (p. 225)—

11. मि फे or है. 2 द व. 3. सि नि or ग

Into the intricate changes rendered necessary by the addition of these suffixes in the terminating vowels of nouns, etc., it is not necessary here to enter. (## is undoubtedly the Pr. gen. ##, and is still sounded me in Pushtu, but m in Persian; ## from Pr. ## by elision of ##, so also the third person f## from ##. In

the plural, is or st, which appears to be used only with pronouns, is by Trumpp referred to the Pr. form west (rather west), which, however, hardly accounts for the anunasika: a more probable origin would be from west, reduced to west, and thus to st and st; the second person we recalls Pr. wit, and the third person of from waste, a Pr. gen. pl. of the base which we have already seen is substituted for that of the near demonstrative used as a third person.

The general rule for the method of adding these suffixes appears to be that the noun undergoes merely euphonic changes of its final vowel, but not constructive changes, and the discussion of them pertains rather to the study of the individual language than to that of comparative grammar. The Old-Hindi and Bengali, and to a certain extent also modern colloquial Oriya, exhibit the beginnings of a tendency to this system, which, happily for these who had to speak the languages, did not get beyond the first stage, namely, using the crude form of the personal pronouns, as in Chand's all fun "my father," all until "thy feet," and in Mod.-Oriya all un "my house." It wanted but the shortening of the vowel and the change of position to load us with forms like unit, fung, and the rest.

§ 76. Not only do the substantive and adjective pronouns run in perfectly analogous series, each distinguished by the typical initial consonant or vowel, but a long string of adverbs also follows this analogy. At the risk of a little repetition, it will probably be as well to group together, so that the eye can take them all in at a glance, the whole of these concurrent forms, in a series of tables.

all the other languages.

The adverbe will be explained in their proper place, and all the pronouns have been commented on above. The forms in use are often numerous, especially in Sindhi; thus the demonstratives gi and g are pronounced t and 3 in Lar, or the coast district of Sindh. In Gujarati the adverb of time appears as wait. will, will, successive stages of shortening; and many other trifling dialectic variations occur; but in the above tables only one, and that the central or typical form, has been recorded, except in cases where two forms appear to be used with equal frequency, in which case both are given. Much of this redundance of form is doubtless due to the absence hitherto of any settled standard of spelling in all the languages. Nativa scholars have unfortunately set themselves to improve their mother-tongue by the resuscitation of Sanskrit words, instead of striving to fix the orthography of the words really in use among their contemporaries; and from this mislirected energy of theirs it has too often resulted that the language presents a disjointed haterogeneous aspect, certain parts of it, as the nouns and the nominal part of compound verbs, being highly refined classical Sanskrit; while other parts, as the inflectional and connecting partieles, are rule in form and unsettled in orthography. This unfortunate practice, moreover, has misled such European scholars as have taken a cursory glance at the subject into supposing that the modern languages are far more closely allied to Sanskrit than they really are; and Bengali, which, from its phonesis and organic structure, is proved to be a very poor and rustic patois, has had so many "purpurei panni" sewn on to it, that it has been regarded as the eldest daughter of Sanskrit, which has preserved, with greater fidelity than its sisters, the family type.

It is in truth one of the youngest grand-daughters; and an examination of its essential features shows that it has wandered further from the original forms than any of the allied speeches.

§ 77. Besides the pronouns which have been arranged in classes above, there are certain miscellaneous pronouns which it is difficult to classify exactly under any of the heads which have preceded. Such is S. Hy "all," which is declined throughout, so is G. Htq, while in the other languages it is indeclinable, as H. सब, P. सभ, O. सबु, B. सब. Traces remain of this pronoun having been inflected in Old-H. wir, which seems to be a reproduction of Skr. 44. S. has also an emphatic form wait "every one," also compounds समुको and समुकोई. These two Istter are treated as compounds in S., but their equivalents are written as two distinct words in the other languages. In S. it is necessary to regard them as compounds, because HH being capable of inflection, if it were written as a separate word it would have to be inflected also. Unique, as far as I have been able to ascertain, is the curious S. adjectival pronoun first, or सिद्धोई m., सिद्धाई f., meaning "every," which seems to have come from Skr. we, originally of course meaning "mortal," but subsequently shading off into the meaning of human beings in general, just as Latin home has become French on, or as in German man has lost its distinctive meaning, and now implies merely "they," "people in general," and the like. He would become near, and by further softening, aided by the fondness of Sindhi for the i-sound, it would successively be well and मिड्यो. The र is merely the emphatic increment, as is shown by the fact of the inflection taking place in the syllable which precedes it as it does in Hair also, thus :-

The ablative plural shows the form of the synthetic abl. in wit, with the emphatic & added, thus wint. Only the obl. sing. fem. seems to show some divergence. The feminine of an adjective in o generally ends in i, and its formative or oblique in in, as will "dry" (m.), will (f.), obl. fem. will we have happened is, that the type of the oblique is has been added to the irregular feminine in a, and the emphatic i altogether omitted.

In समुको a double inflection occurs; thus fem. समका, where सम is fem. of सम, and का fem. of को; but in the declension no further change takes place in the termination of the first number of the compound, which remains सम throughout.

Although we is in the languages where it occurs indeclinable, yet H. P. and G. have a declinable adjective from we, which takes the form m. HICL. J. HICL. obl. HIC. and like S. HH. means "the whole." P. declines HH in the oblique, as HHHI; the latter is an instrumental, but is used as an oblique with the objective affix AIC in the first line of Bhai Mihr Singh's "Panjāb dā Roshan Kissā."

# सचा साई समनीं ताई बुद्रति जिम खिलारी।

"The true God who has spread out his power for all."

Similarly Panjabi makes a declinable word out of the indeclinable H. Tr. "other," also used as a conjunction "and."

<sup>&</sup>lt;sup>1</sup> This work was written for mr by the unifor, and is in the purest Panjabi of Gujint, a town in the most fertile pertion of the Panjab, near the banks of the Chenab. The MS, is in my possion, and her rever been edited or printed.

This is in Old-H. we, and sometimes wy, which betrays its origin from the Skr. preposition we. In P. six means "other," and it is declined in the oblique pl. gitt "others," and होरना. It has also an indeclinable form होरस, which is analogous to with, and has the genitive case-ending irregularly tacked on to it. In such forms as समग् and शारना, an irregular w has been inserted between the stem and the termination. This is probably due to the tenacity with which all pronouns retain archaic forms; the nom. pl. of the old declension would have been समान, होरनि, and in adding the plural oblique (i.e. Prakrit gun. pl. Wil) ending, which is Wi. it has been forgotten that the w of wufw is an inflection, and a new plural base समन has thus been formed, to which the oblique has been added. The same process has operated in II. wuff, where the H of wunt has similarly been incorporated into the stem. In all languages of the Indo-European family such eccentricities are found in the pronoun, and had their origin at that stage of the progress of language when the old synthetical forms were breaking down and becoming confused. and before altogether disappearing, were being used in a way which would have broken the heart of Cicero to hear. Precisely similar to such forms as सभागे is the French "leurs;" the Latin genitive mase, illorum becomes "leur"="their," and like the modern Indian genitives, has become an adjective, and, as such, has been supplied with the plural sign s, which comes from os, the termination of the Latin accusative, so that "leurs" . would be translated back into illoramon! just as सभा contains the elements of Skr. सर्वाणि + आना. So also Italians, forgetting that loro=illorum is already a genitive, prefix to it the genitive preposition, and say di loro="of them," as also da loro, "from them," and con loro, "with them," as if a Roman should have said de illorum, de ab illorum, cum illorum. Thus language plays sad tricks with ancient forms, whose meaning has ceased to be felt or understood. Not less eccentrically Hindi says

आपस में "among themselves," as if there had existed a Sanskrit phrase water war. Priscian in the one country, and Panini in the other, had, fortunately for their peace of mind, passed away before such processes were invented. Panjabi uses a genitive case-affix with आपस, and makes आपस दा, and an objective आपस जु, also an ablative आपस ते. When a formwhether derived from a nominative or from an oblique formin Prakrit had once established itself in the mind of the hornyhanded Panjabi peasant, he, knowing nothing about direct or oblique forms, treated it as a stem, and added the usual caseendings to it. So true is it that man is not the master of language, but merely the instrument by which the processes of speech develope themselves according to natural laws. Man in fact makes nothing; nature makes, and man morely places materials in such a position that the forces of nature can work on them. Man collects the wood, applies the fire, and sets the pot on it; but the forces of nature thus brought together boil the water in the pot. So man utters sounds by means of his vocal organs, but nature controls the form which his utterances shall take; and man unconsciously works out great and deepreaching developments of speech far beyond his cognisance or comprehension.

Compound prenouns are in common use, but they present no remarkable features. The laws of their composition may be studied in the grammars of the several dialects, but do not come within the scope of a work which deals with structure only, because structurally they have nothing to be explained beyond what has already been stated when treating of them separately.

Gujarati has two pronouns peculiar to itself. One is **पोत**, pl. "self or selves," obl. **पोता**, the origin of which is by Taylor (p. 73) correctly referred to the Skr. **पात**:; the **प** of **v** being hardened to **u** and the **v** dropped, the visarga becomes **v**, and the ablative affix **v**, having lost its special signification, has been applied to all the cases of the pronoun. The word seems

to have been formed in two halves, as it were: [4]: becoming separately [4] and [4], and the affix as becoming separately [5]. The word when first compounded must have been used adverbially, "by themselves" or "of itself;" and then, through the common custom of forgetfulness of its origin, the compound has been treated as a nom. pl., and regularly inflected. A regular form [4] as still in use, but as a distributive, and with the full form [4] added to it; thus [4] [4] [4] [4] [4] [5] they went each to his own house," literally, "they his own, their own, house went."

The other pronoun is quit, a remote demonstrative "that," which is also written quit. The origin of this word is uncertain. Quit means "first," but I think this is a different word from quit. After s the Gujaratis often insert in speaking an inorganic w, so that the two words come to be alike. My own idea is that quit is shortened from quit, and that again from quit, a secondary formation from quit distant," just as in Panjabi we have user "on this side," quut "on that side" (of a river, road, etc.), so that quit would literally mean "yonder," just as in the colloquial English of rural counties we hear "yond man," or "yon man," for "that man," German jener = "that."

§ 78. The language of the Gipsies in various countries of Europe, though its vocabulary is a medley of words taken from the languages of all the lands in which this strange race has sojourned, is purely Aryan in its structure; and Modern-Aryan too, being in many respects quite as far removed from the old synthetical system as any of the seven languages now under discussion. In respect of the pronouns, other than personal, it preserves the traces of its origin very clearly. Thus we have the interrogative kon "who?" kāyā "what?" with its oblique kas, also kalés, pl. oblique kalén, and the indeclinable ka "which." In addition to this, they have a more definite interrogative kacā,

which in sound and meaning is almost identical with G. Lat.

It is singular that they have also the unique (so far as the Indian languages go) G. L. Gipsy so, from which comes an ablative sostar, which, when pronounced with the accent on the first syllable sostar, means "why?" but with the accent on the last syllable sostar, "because," literally "from what." From this again comes a further interrogative save "qualis?" parallel to kard. The Kashmiri, with which the language of the Gipsies is most generally in accord, here diverges from it, and the connexion is closer with Gujarati than with any other of the languages. Kashmiri has gu and gu for "who?" or "what?" oblique kas as in Gipsy, but here, as far as the meagre information accessible enlightens us, the resemblance stops, and Kashmiri runs into its usual similarity with Panjabi.

The reflexive pronoun "self" is represented by forms derived from the stem \*\*\text{uq}\$, as mase, po, fem. pi, obl. pc. An older form, which Paspati (p. 71) says is rare in the present day, is piaro m., piari f., piare obl. Here we see \*\*\text{uq}\$ with the loss of its initial d and the old genitive affix ro, ri, re, shortened from koro. With this agrees the possessive of the two first personal pronouns minro, ri, re, "mine;" tinro, ri, re, "thine;" and plurals strikingly Indian amaro, ri, re, "our;" tamaro, ri, re, "your." But the language still possesses the simple genitives mo, to, as in H. B. O. \(\vec{\vec{vq}}\), \(\vec{\vec{vq}}\), though it differs from H. in treating them as possessives, and consequently as adjectives, and inflects them for gender and case me m., mi f., me obl.; so also to, ti, te. In addition to the reflexive po, pi, pe, it has also per=\*\vec{vq}\) we each other."

Demonstratives are ska and scaka "this," oks, oroks, "that," skarks and okoska "this here," "that there," which do not ally themselves very closely to the corresponding words in any of the Indian languages. Peculiar also are kadars in., kadaya f.; kadala nom. pl. m., kadale f., "this," and odors "this." Perhaps we are here to suppose the operation of some influence other than Indian.

The demonstratives aka and oka form sets of parallel pronominal adverbs, just as do the demonstrative types of the Indian group. Thus we have akaté skoté "here and there," akatar, okolar, "hence," "thence." The latter of these corresponds in the manner of its formation to the Panjabi, which expresses "hence" and "thence" by adding the ablative of the old synthetic system under the form "it to the words for "here" and "there" respectively, as tel "here," tell "from here," "hence," 32 "there," 321 "thence." In like manner, for is the sign of the Gipsy ablative. Thus too M. has wat "hither," and the ablatival form gage "honce," so also fra ? and frage "thither" and "thence;" and the same method runs through all the languages, for which reason the words expressive of "motion from" have not been given in the lists above exhibited, as they are merely the ablatives of the words expressive of if rout ot."

The only two authorities for the Gipsy, namely Paspati and Miklosich, which are procurable here, do not give a full series of pronouns and pronominal adverbs; and it may be conjectured that, in the rude speech of this people, they are not all to be found. Those noted, however, are in striking conformity with our Indian group.

§ 79. In concluding, amidst constant interruptions, this volume on the Noun and Pronoun, I have a few further remarks to make of a general character. Attention has already been directed in several parts of this volume to the varying nature of the seven languages in point of simplicity; but the geographical aspect of this question remains to be noticed. The most complicated of the seven languages are Marathi and Sindhi, and, as far as we know anything of it, Kashmiri. If Gujarati and Panjabi were as complicated as these three, then we might establish a regular gradation from cust to west; for the Oriya and Benguli, the most eastern members of the group, are distinguished by

extreme simplicity; while the Hindi, the central language in position, is central also in this respect, being less simple than B. and O., less complicated than M. and S. It will be remembered that in the First Volume Hindi was noted as central in respect to its phonesis, leaning neither to the peculiarities of the extreme castern dialects, such as a fondness for long vowels and the s-sound, nor to those of the western dialects, a prediffication for short vowels and the s-sound. As regards the structure of the noun, the homogeneity of the western group is disturbed by P. and G. The former, with its structure only alightly less simple than Hindi, lies between the intricate Sindhi and the no loss intricate Kashmiri; while the latter also, only a little more full than Hindi, intrudes between Sindhi and Marnthi.

The comparatively simple structure of Panjabi, as compared with its neighbours to the north and south, is probably to be ascribed to the fact that the Panjab has been for numerous centuries the battle-ground of India, over whose plains have passed and fought Greek, Persian, Arab, Turkish, and Indian armies; from all, except perhaps the first, of whom the language has imbibed words and ideas, and has been led to reject much of its former complicated structure. Since the establishment of the Musuhman on the throne of Delhi, it has been constantly ruled from the Hindi area, and so strong has been, and still is, the influence of Hindi, that the wonder is that anything should be left of a distinctly dialectic character. As it is, in the towns and more civilized portion of the country, Panjabi is fast disappearing, and will in all probability disappear entirely at no distant date.

The simplicity of Gujarati has been frequently explained in these pages by a reference to the fact that it is a dialect of Hindi, separated at an early, but not precisely assignable date, from the parent language, and thus retaining a certain amount of archaism.

§ 80. With regard to the two eastern languages, much remains for future research to make plain. In Orisas the traces of a large non-Arvan element in the population are potent to the most superficial observer, and the same may be said of Bengul; but unfortunately neither of these provinces has as yet been examined, either as to their language or ethnology, as thoroughly as could be desired. The Europeans resident in India are all busy men; no one of us comes here except to work, and as a rule to work very hard. The machinery of Government becomes more complex, and makes greater demands upon the time of members of the administration every year; so that those whose previous training would best qualify them for the task of investigation have as a rule the least leisure for it. It is not possible for scholars in Europe to conduct minute inquiries, because the materials they possess refer rather to ancient than modern India; and it is necessary that one should live in the country itself, and in daily communication with its people, in order fully to breathe the spirit of their customs and institutions, and so to get an insight into the nature of them, such as may indicate the most promising line of inquiry to follow. There are more materials for Orissa than for Bengal, because the former province was more isolated, more homogeneous, more bound up in itself, more a nation in short than Bengal for many centuries; and the records of the great idol-temple at Puri, together with others which are probably still to be found in various holes and corners of this most conservative of Indian provinces, will, when they can be got at and examined, probably yield a rich harvest of facts to the labourer in the departments of history and philology.
